

## Assimilating aerosol optical properties related to size and absorption from POLDER/PARASOL with an ensemble data assimilation system

*in other words...*

*Use satellite observations (aerosol amount, size & absorption) to “correct” the model*

Assimilate AOD<sub>550</sub> & AE<sub>550-865</sub> &

# Works even with Independent Observations (e.g. AERONET)

# Conclusions

First assimilation system for the global aerosol climate model ECHAM-HAM that successfully assimilated multiple aerosol optical retrievals of POLDER-SRON using an ensemble Kalman filter.

- Assimilating a combination of aerosol optical properties simultaneously (e.g.  $\text{AOD}_{550}$  &  $\text{AE}_{550-865}$  &  $\text{SSA}_{550}$ ) improves the aerosol mass, size and absorption representation in the model and is preferable than  $\text{AOD}_{550}$ -only assimilation.
- The assimilation successfully reduces biases against assimilated (POLDER) and independent (AERONET) retrievals.
