AERONET Maritime Aerosol Network

10th AeroCom Workshop（Fukuoka：2011.10.5, Kazuma Aoki)

What is the SKYNET?

(Prof. Takamura, CEReS, Chiba Univ.: http://atmos.cr.chiba-u.ac.jp/)

SKYNET super site
Cape Hedo, Okinawa, Japan (NIES)

1. SKYNET is a network to measure the atmospheric radiation budget and related atmospheric parameters, such as aerosol, cloud and so on.

2. SKYNET has an objective to estimate climatic impacts due to atmospheric parameters.

3. SKYNET is a useful validation network for satellite products (ADEOS-I, II, GOSAT, GCOM & etc) and numerical model (SPRINTARS & etc).

4. SKYNET project is a grass roots effort by many researchers who are interested in above items.
About 50 site in the world

@ etc

We started the long-term monitoring of aerosols since 1994, by using a sky radiometer (Prede Co. Ltd.,) on SKYNET project. We are seeking in this data information on the aerosol and cloud optical characteristics with respect to their temporal and spatial variability and validation of Satellite and models

Detail of sky radiometer

$$R(\Theta) \equiv \frac{E(\Theta)}{Fm\Delta\Omega} = \omega\tau P(\Theta) + q(\Theta)$$

Aoki and Fujiyoshi, 2003, JMSJ

Ground-based   Ship-borne

- We observed only in daytime under clear skies at each site.
- Every 10 min/once (aureole)
- Every 1 min/once (direct)
- Data have been analyzed by an inversion software called **SKYRAD.pack** (Nakajima *et al.* 1996). Available version are SKYRAD.pack 4.2. L0, L1 and L2.
- **POM-01**: 315, 400, 500, 675, 870, 940, 1020 nm
- **POM-02**: 315, 340, 380, 400, 500, 675, 870, 940, 1020, 1627, 2200 nm

Comparison between SPRINTARS and SKYRAD

SPRINTARS
(Spectral Radiation-Transport Model for Aerosol Species)

SPRINTARS is based on a atmospheric general circulation model developed by Center for Climate System Research, University of Tokyo, National Institute for Environmental Studies, and Frontier Research Center for Global Change (CCSR/NIES/FRCGC AGCM), and treats main tropospheric aerosols both from natural and anthropogenic sources (black carbon, organic matter, sulfate, soil dust, and sea salt). They are also categorized into PM10 and PM2.5. SPRINTARS calculates transport processes of aerosols (emission, advection, diffusion, wet deposition, dry deposition, and gravitational settling). The aerosol direct effect, which is scattering and absorption of solar and thermal radiation by aerosols, and the indirect effect, which is act of aerosols as cloud condensation nuclei and ice nuclei, are included in the calculation.

Present specifications
SPRINTARS version 3.84
horizontal resolution: T213 (0.5625 degrees
longitude/latitude) or T106 (1.125 degrees
longitude/latitude) or T42 (2.8125 degrees
longitude/latitude)
vertical resolution: 56 or 20 layers (sigma coordinate)

SKYNET Sky radiometer network.

The Sky radiometer is a portable instrument that takes measurements only during daytime under clear sky condition. It observes both direct solar irradiance and diffuse sky radiation at every 10 minutes.

Present specifications
SKYRAD.pack version 4.2 L1 and L2 data

- ✓ Aerosol optical thickness at each wavelength
- ✓ Ångström exponent
- ✓ Single scattering albedo at each wevelength
- ✓ Size distribution of volume
- ✓ etc

SKYNET/Sky radiometer in East Asia
Kasuga (KSG) Since 2003
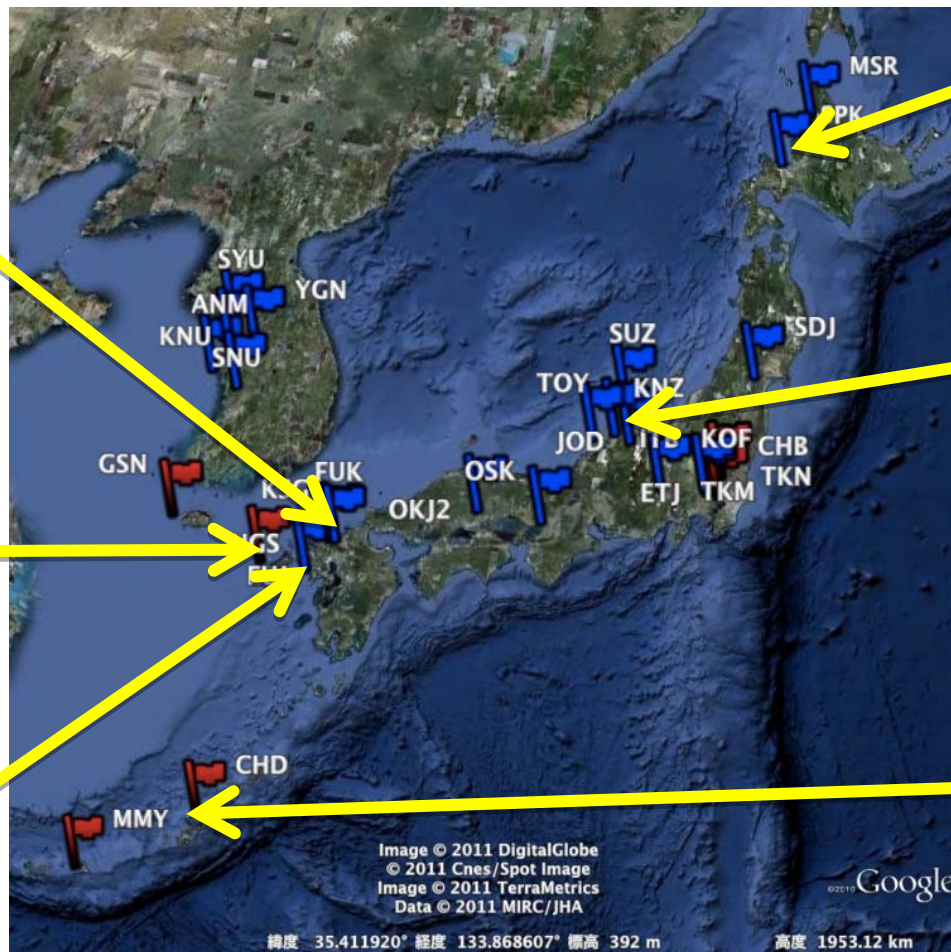

Sapporo (SPK) since 1997
Fukue-jima (FUJ) Since 2002
Toyama (TOY) Since 2002

Nagasaki (NGS) Since 1996

Cape Hedo (CHD) Since 1996

Effect of aerosols between clouds (Hybrid effect)

Aoki and Fujiyoshi, 2003, JMSJ

Clear sky   Aerosol and/or Cloud?   Cloud
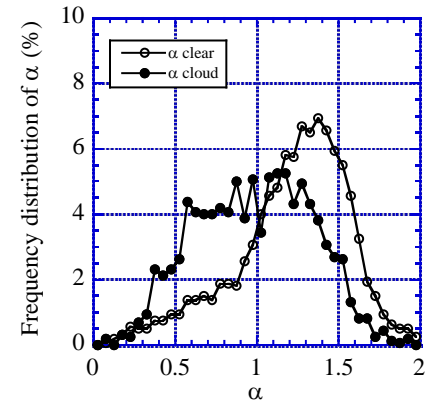

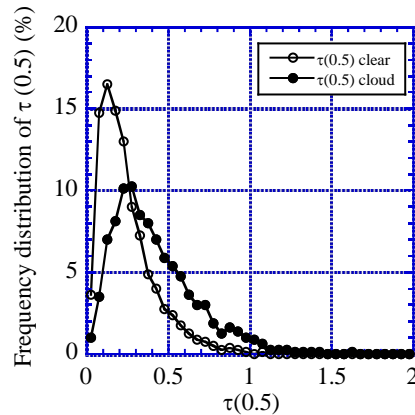

We eliminated 30 to 70% of the initial data because of cloud conditions and other factors. The sky radiometer, however, measures optical properties of aerosols under partly cloudy conditions if there are no clouds within 30 of the solar aureole radiation distribution.

Since the relative humidity is high under cloudy conditions, the optical properties of aerosols that exist in between clouds would be changed. To study the properties, we compare the optical properties of aerosols measured under partly cloudy conditions with those measured under fully fine weather conditions. It was found that the seasonal mean of AOT(0.5) (or Alpha) measured under cloudy conditions was 1.5 to 1.8 (1.1 to 1.2) times as large (small) as that measured under clear skies.
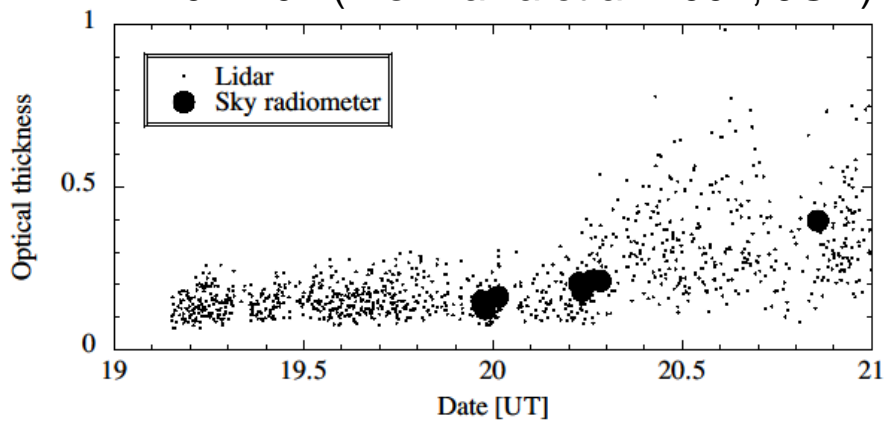

Discussion

✓ What are we need data?

✓ Indirect effect and effect of aerosols between cloud? (include cloud screening)

✓ Comparison
  - ✓ LIDAR, MAX-DOAS and other instruments
 - ✓ Satellite, Model and other
