

# Aerosol “hindcast”: 1980 – present

---

(As a part of AC&C activity)

# Objectives

---

- Aerosol effects on surface radiation – global or regional or local dimming/brightening?
  - GHG warming vs. aerosol cooling?
  - Relationships between emission, aerosol loading, AOD, surface radiation, TOA flux
  - Natural vs. industrial pollution effects
  - Satellite records – long term AVHRR and TOMS, near-term SeaWiFS, MODIS, and MISR
-

# Two phases:

---

## □ 2000 – 2007(8):

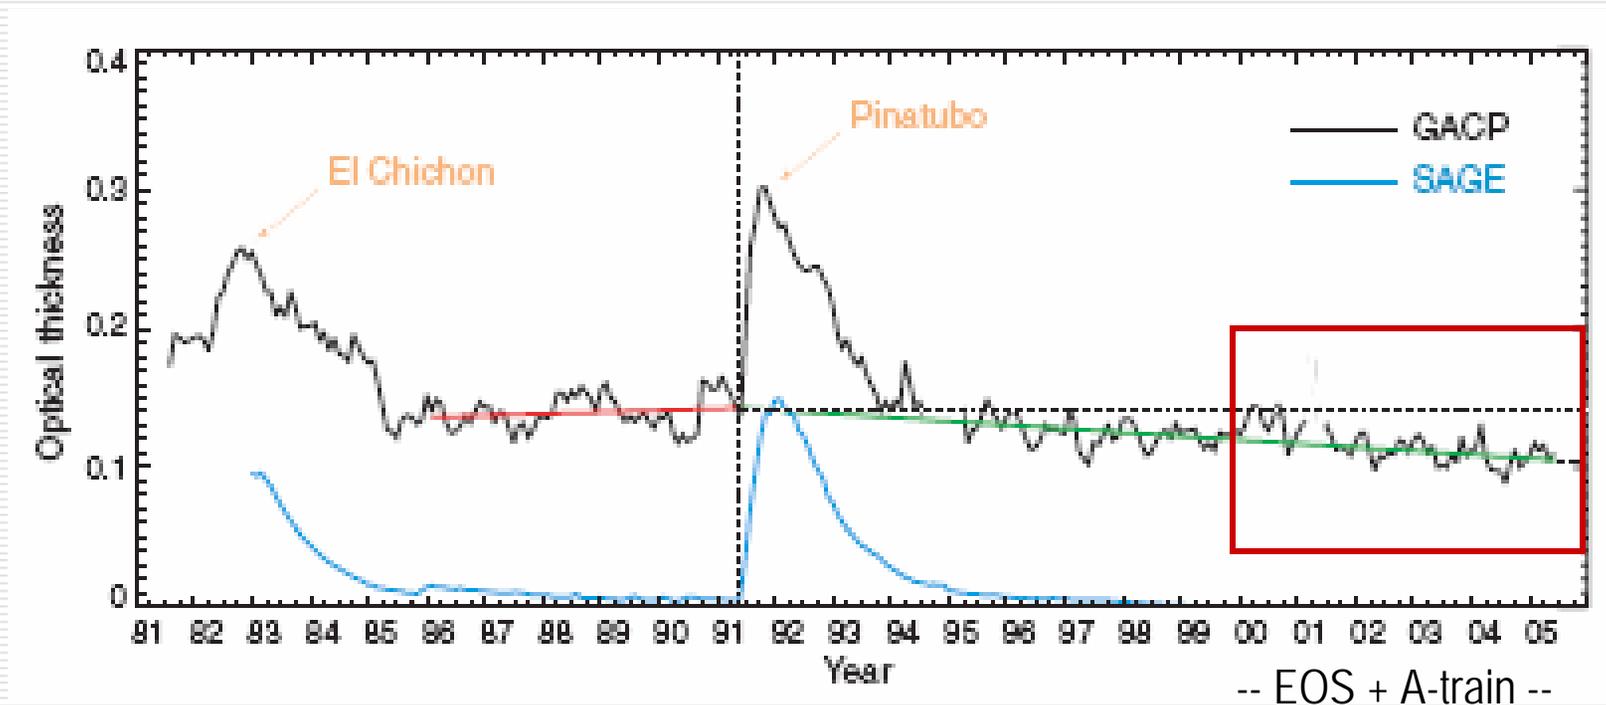

- From EOS to A-train – high quality remote sensing data
- Period covering many interesting field projects (SAFARI 2000, ACE-Asia, TRACE-P, ICARTT, MILAGRO, ARCTAS (POLARCAT)...

## □ 1980 – 2007:

- Satellite era (AVHRR, TOMS, plus EOS and A-train)
  - Transition from “dimming” to “brightening” (and “dimming” again?)
  - Volcanic forcing, ozone depletion
-

# Global aerosol change, 1980 – present

---

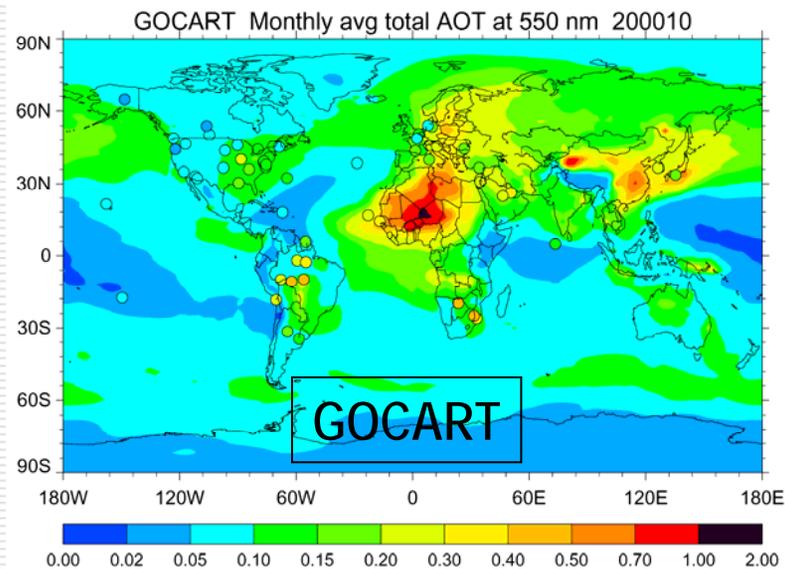

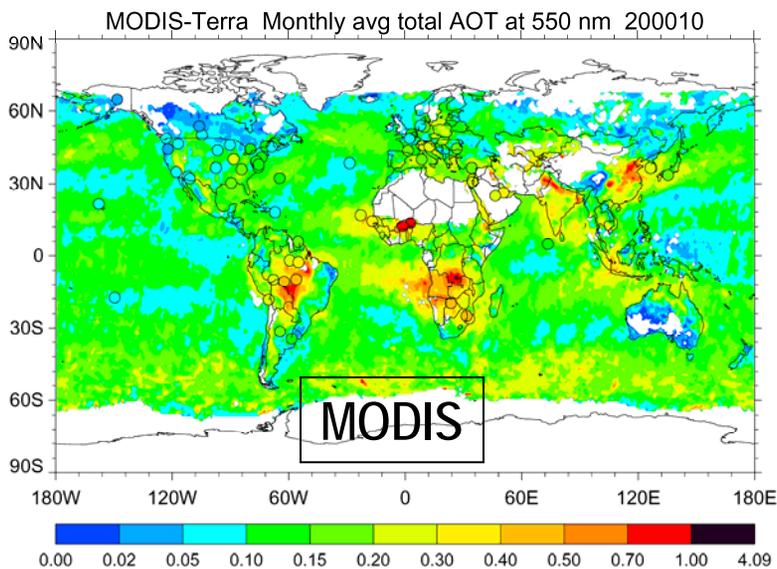

AVHRR global average AOD over ocean, from Mishchenko et al., 2001

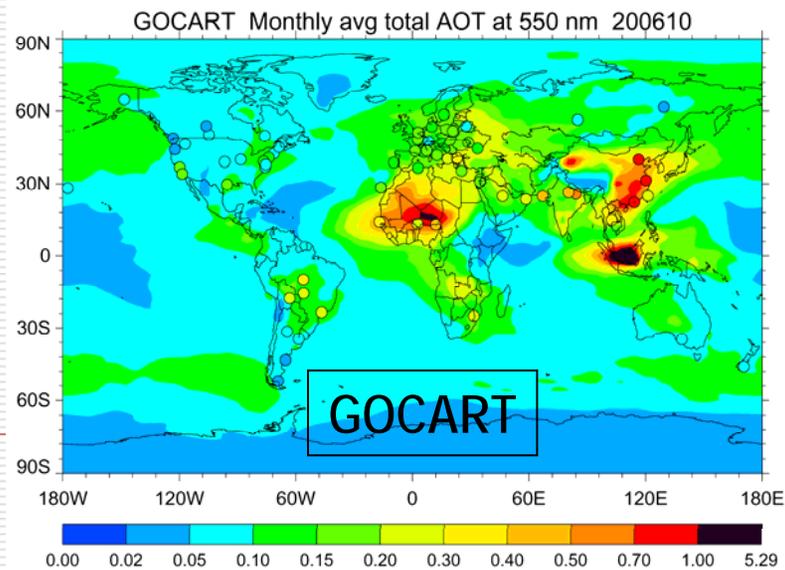

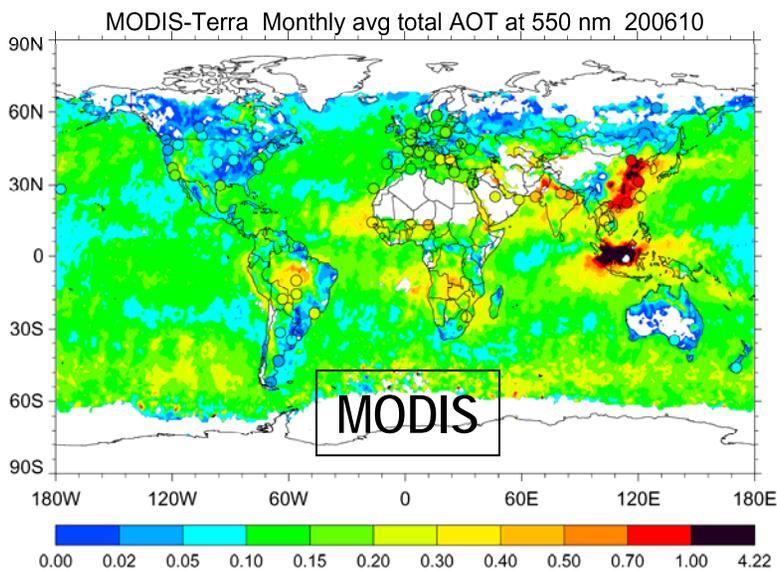

---

# Aerosols in 200010 and 200610:

2000010

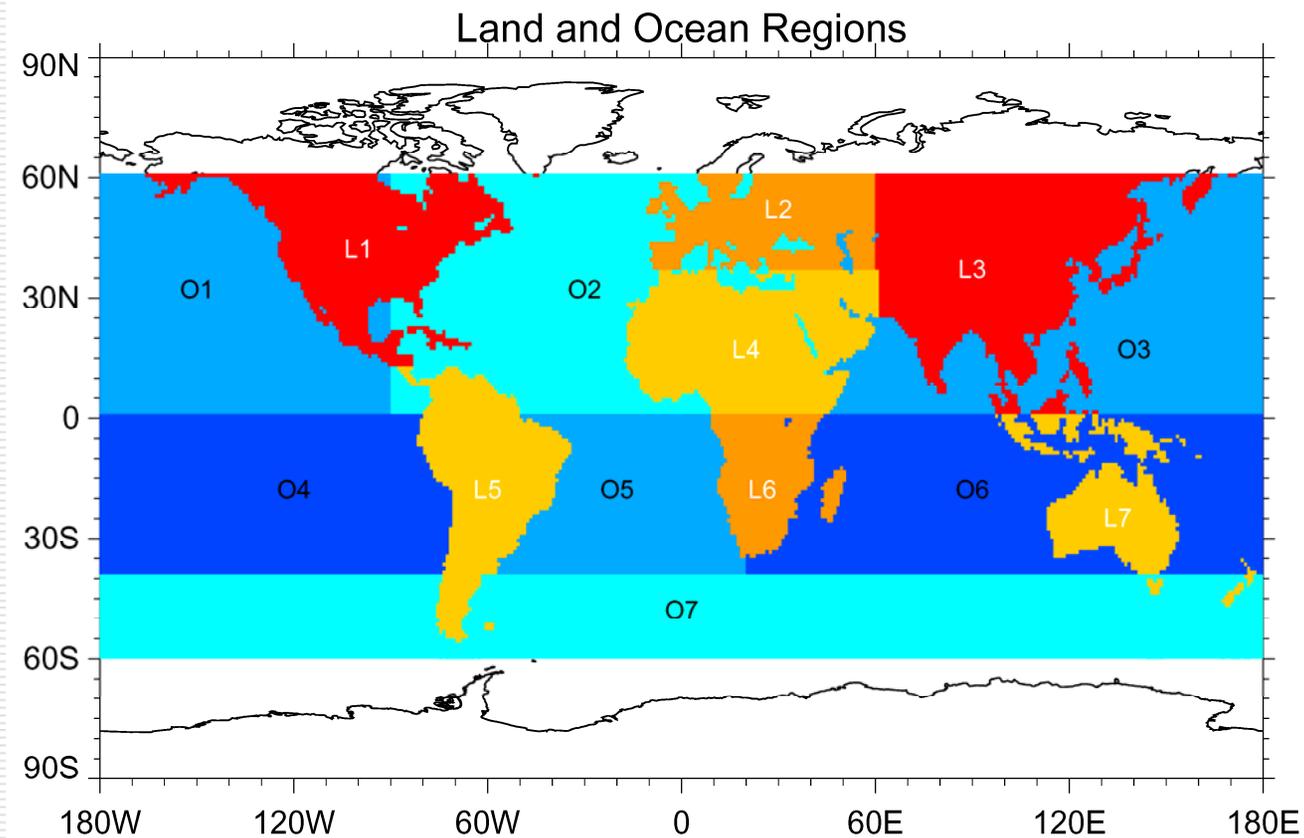

2000610

# Aerosol variations from 2000 to 2006:

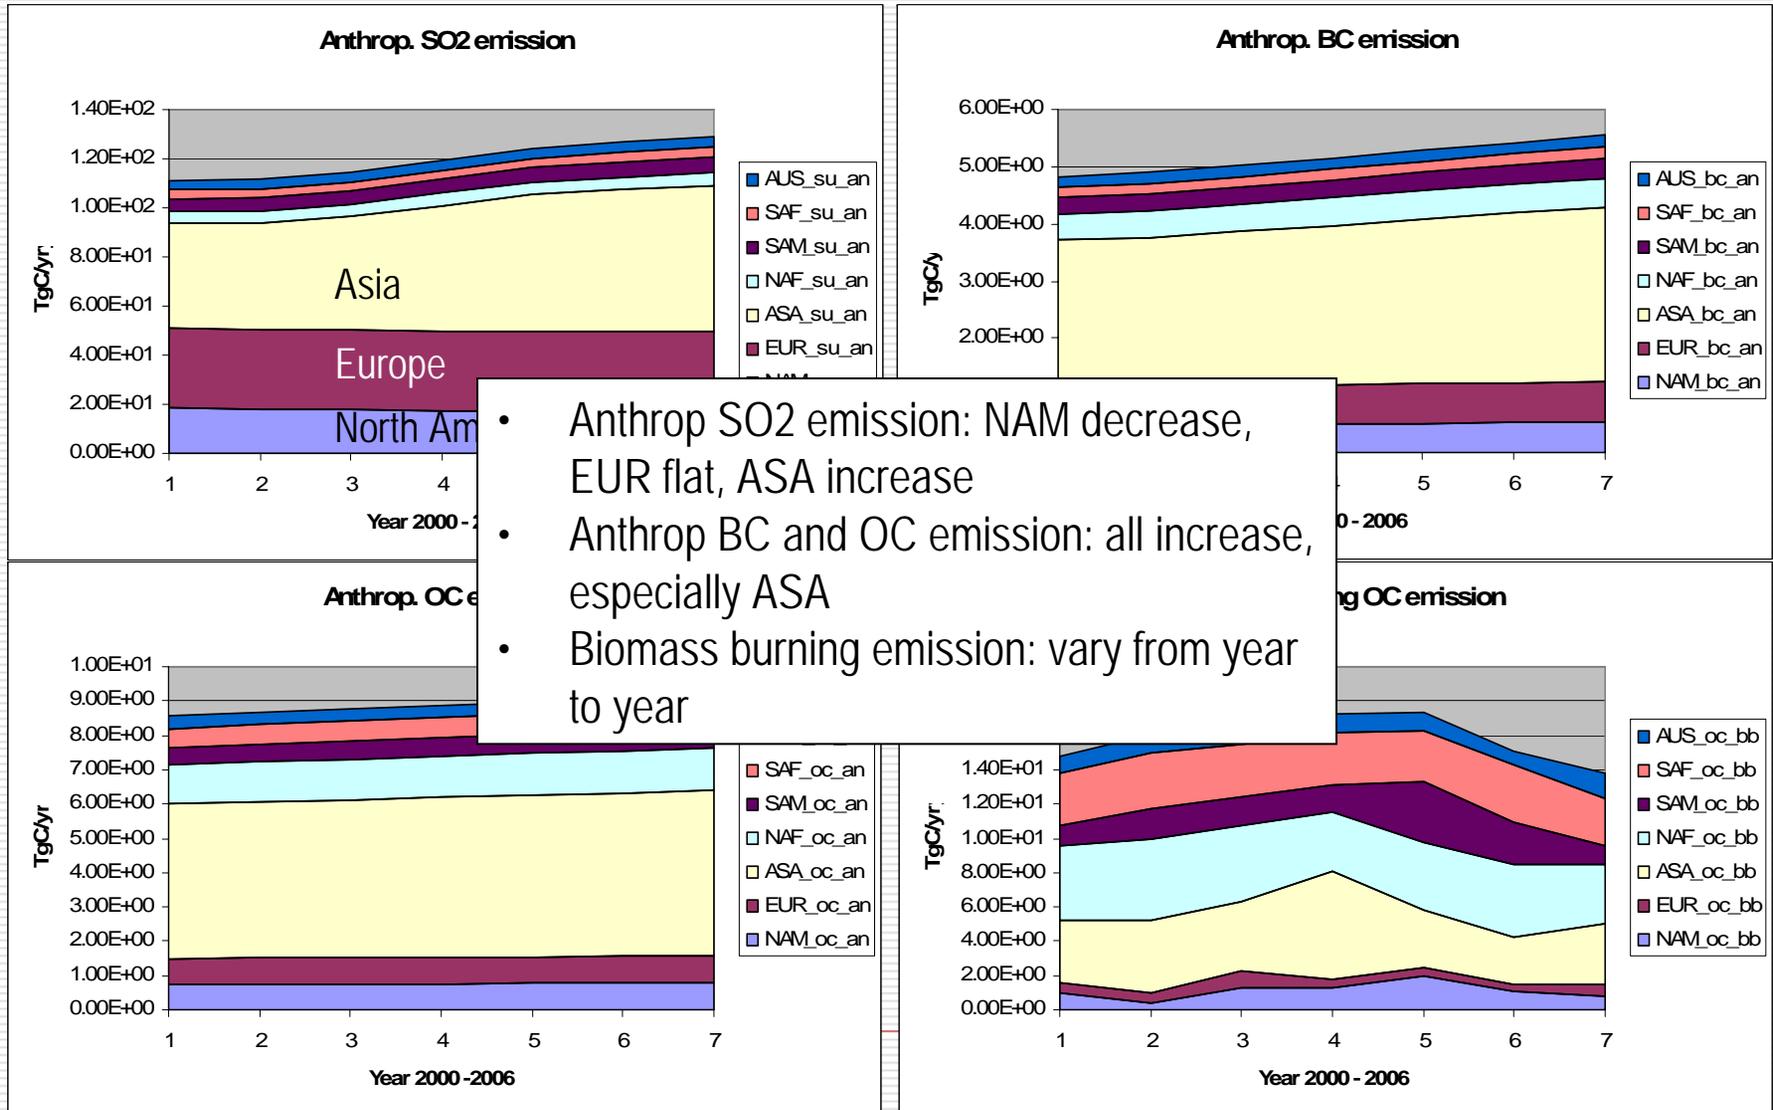

---

7 land and 7 ocean regions:

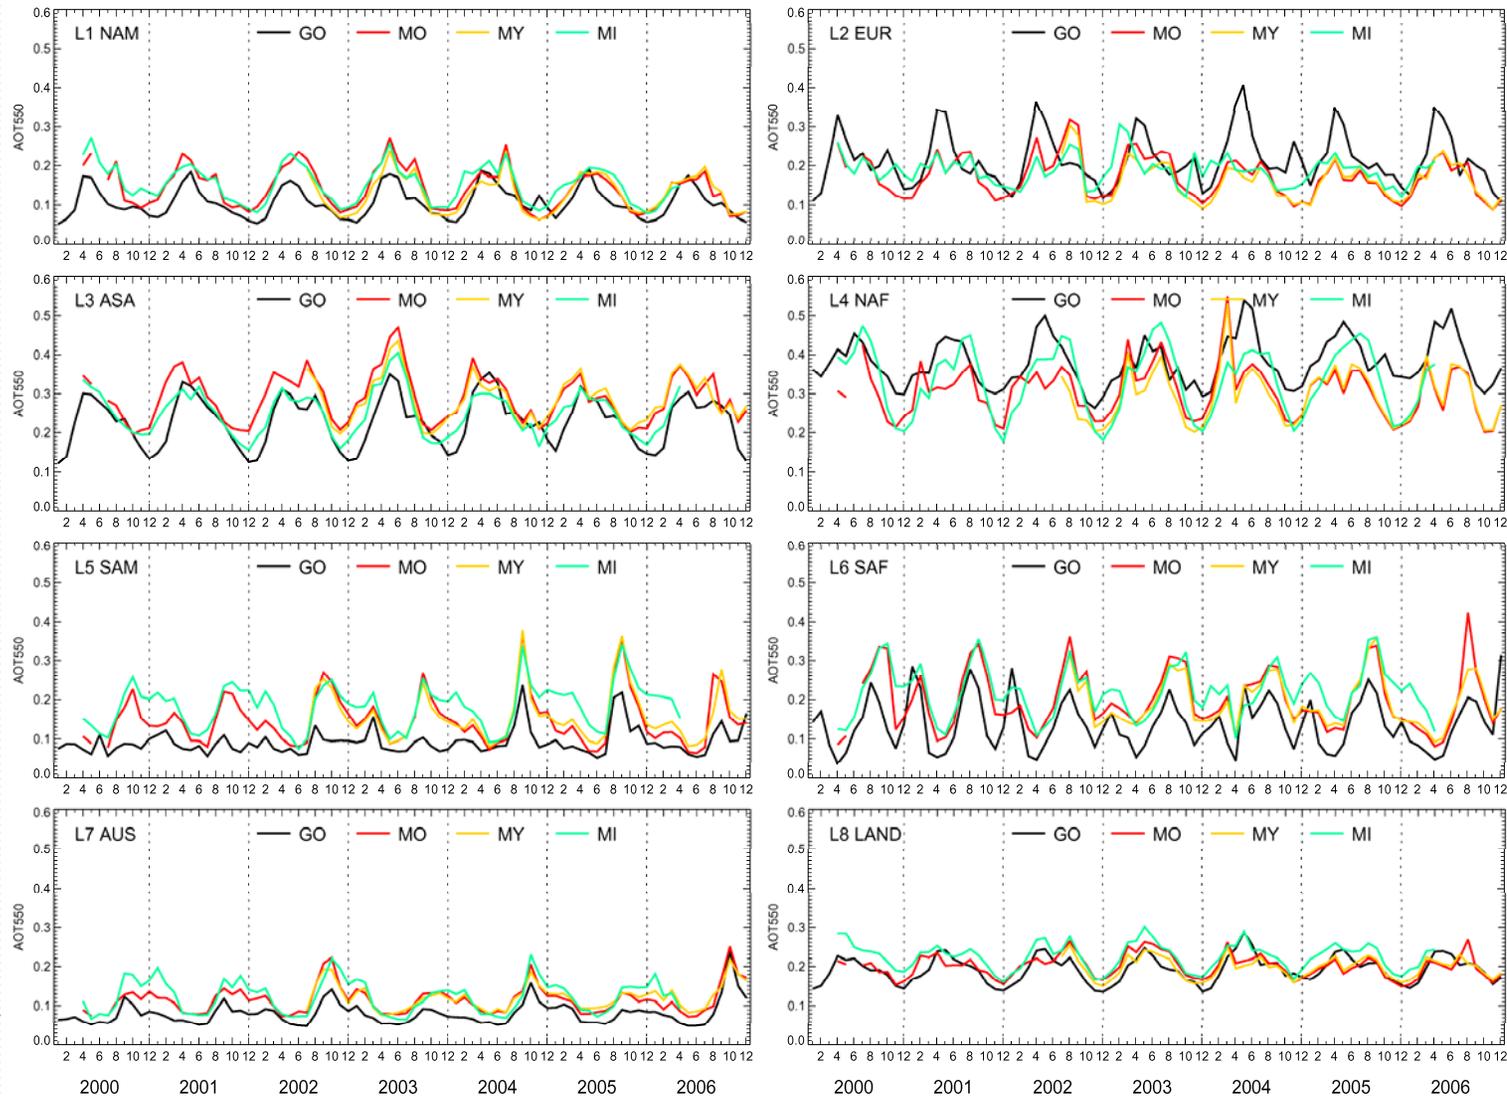

# Pollution and biomass burning emissions, 2000-2006

Anthropogenic emission from David Streets, biomass burning emission from van der Werf et al. 2007

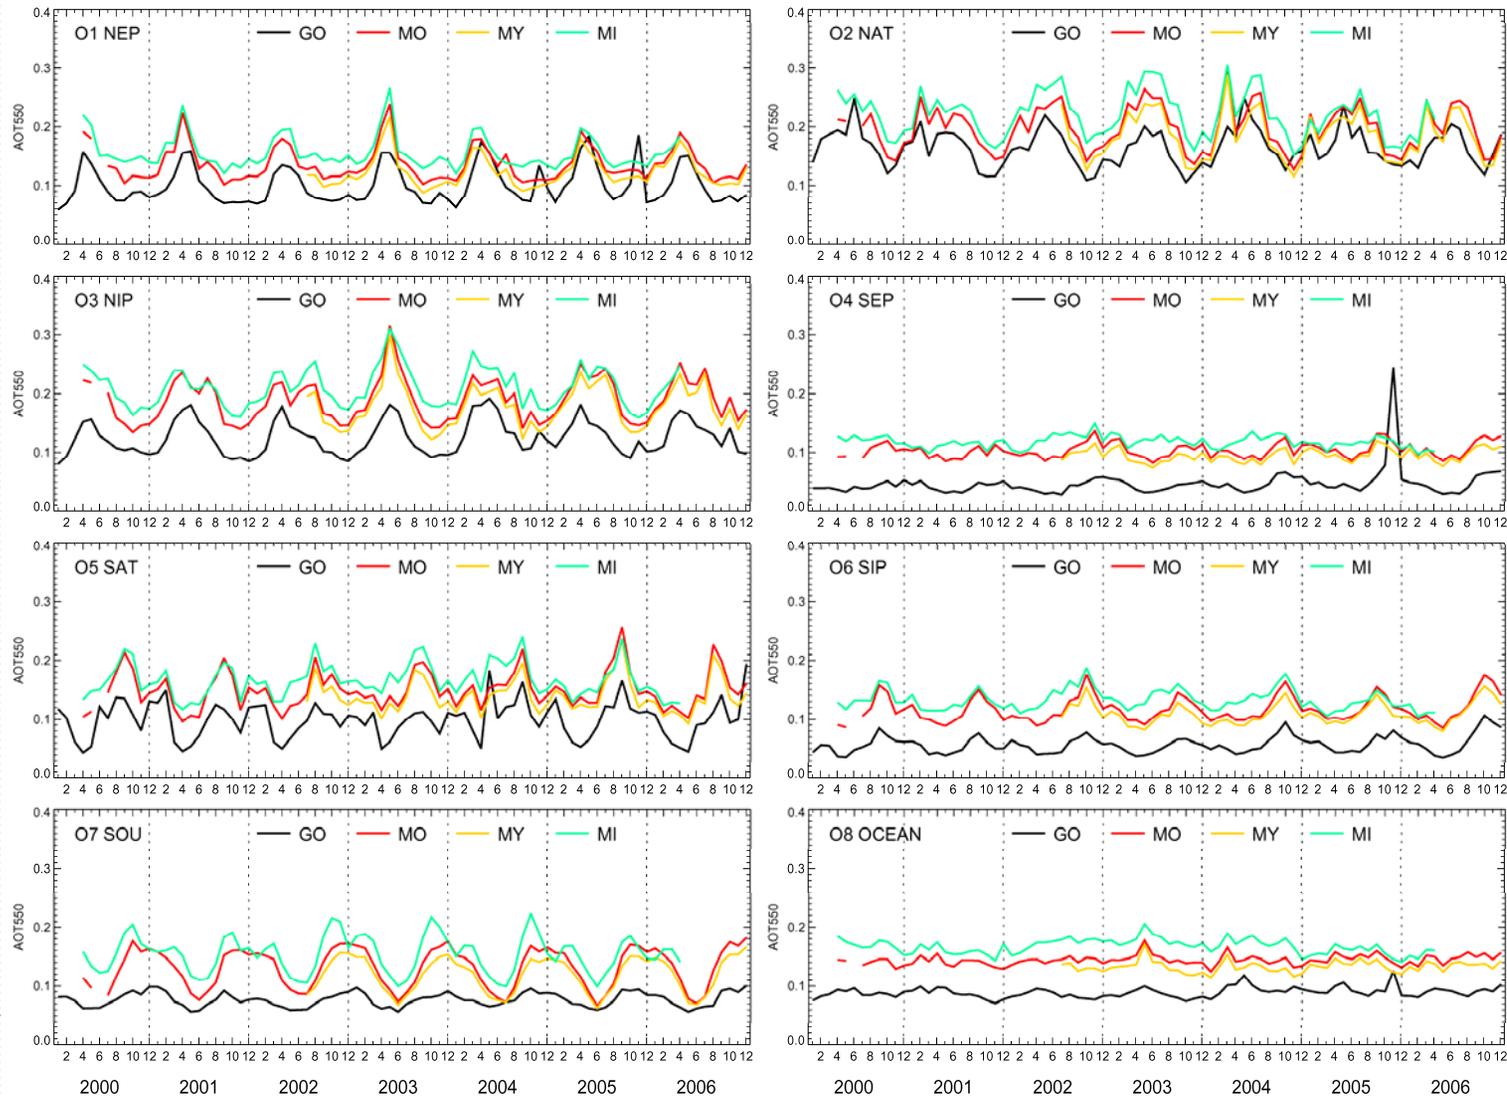

# Variations of AOT over land from MODIS, MISR, GOCART

GO=GOCART, MO=MODIS-Terra, MY=MODIS-Aqua, MI=MISR

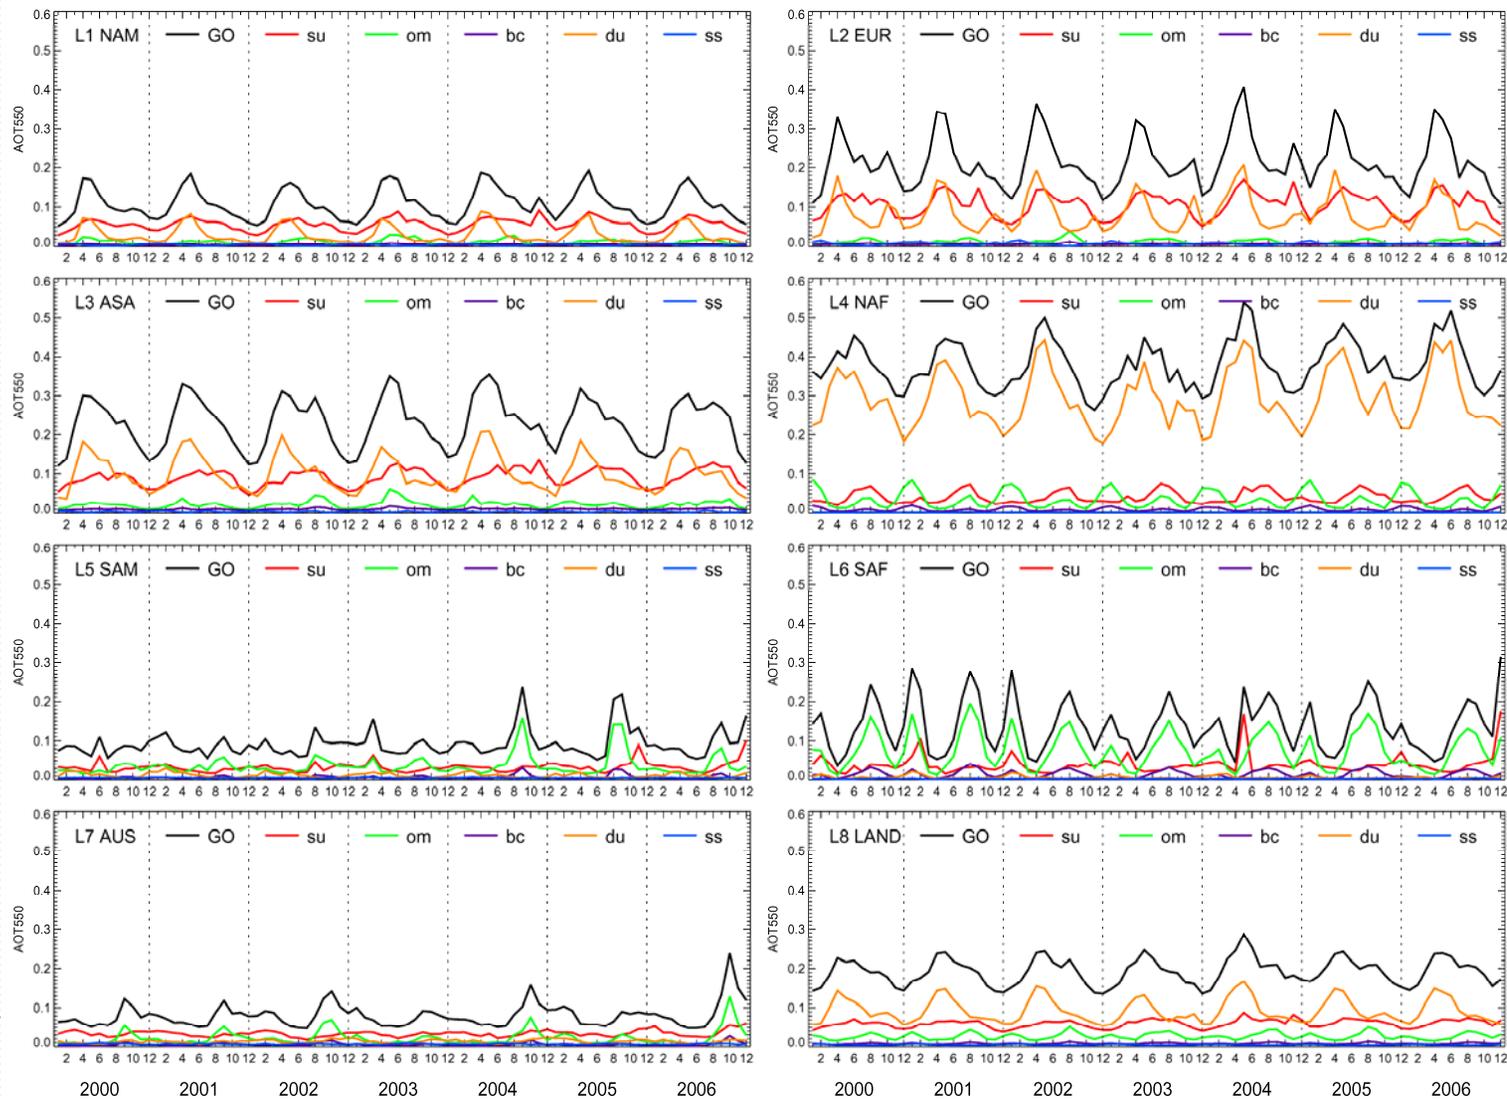

# Variations of AOT over ocean from MODIS, MISR, GOCART

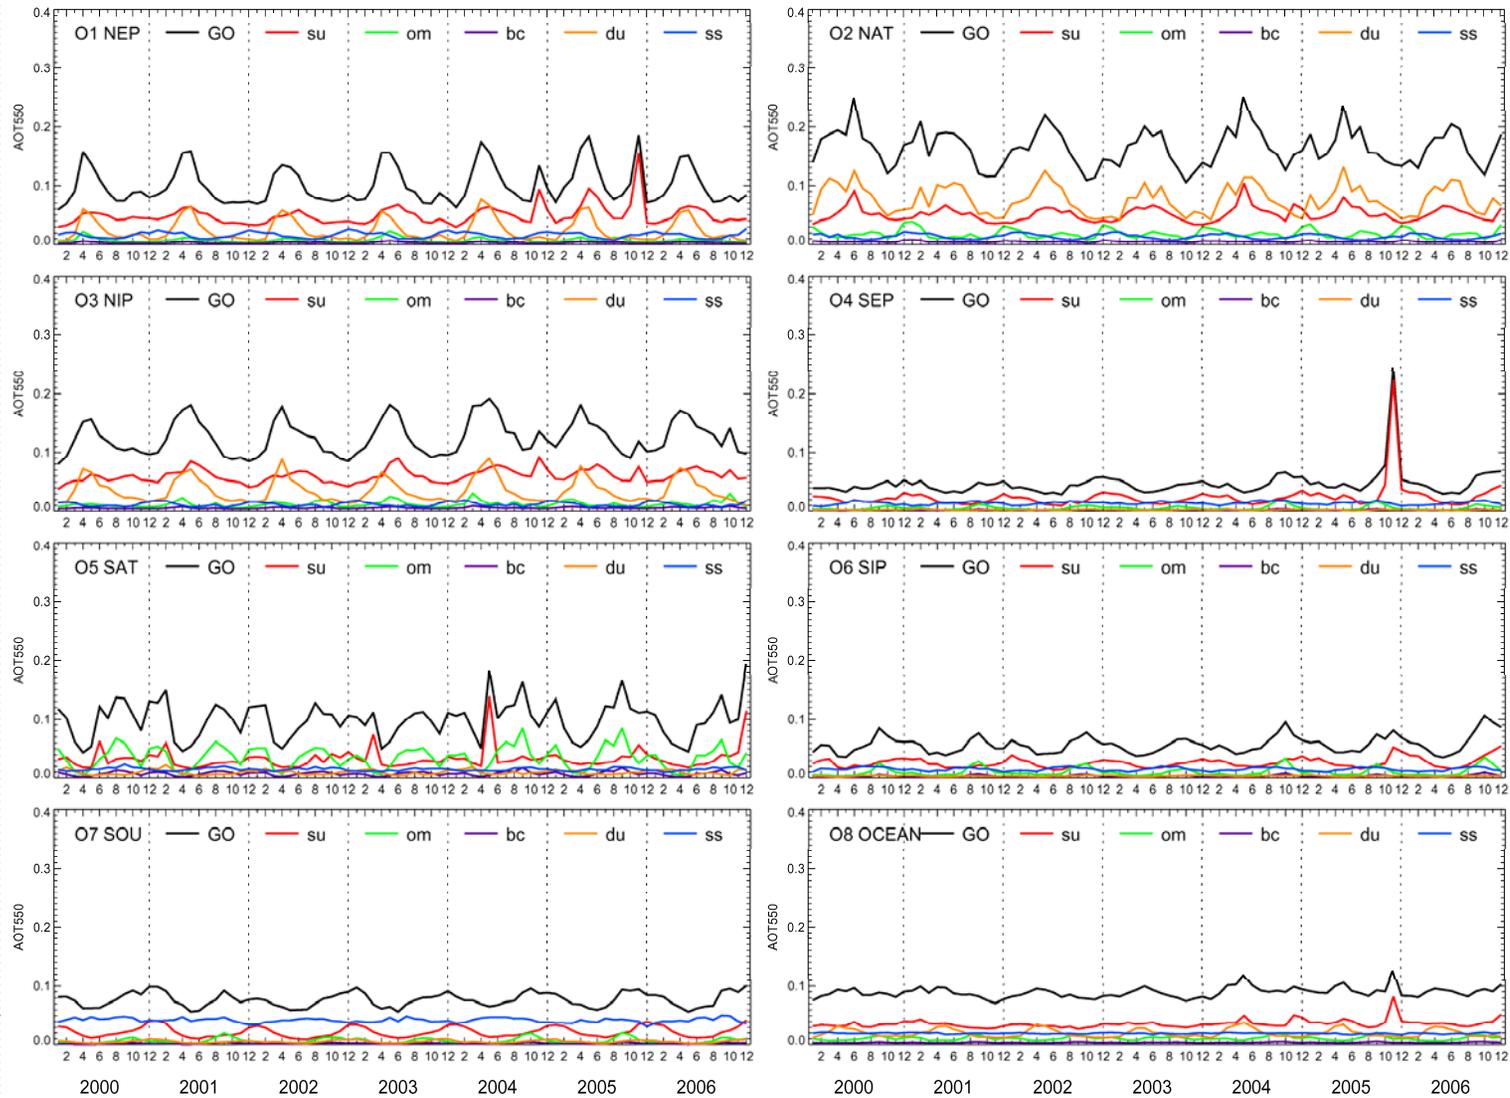

GO=GOCART, MO=MODIS-Terra, MY=MODIS-Aqua, MI=MISR

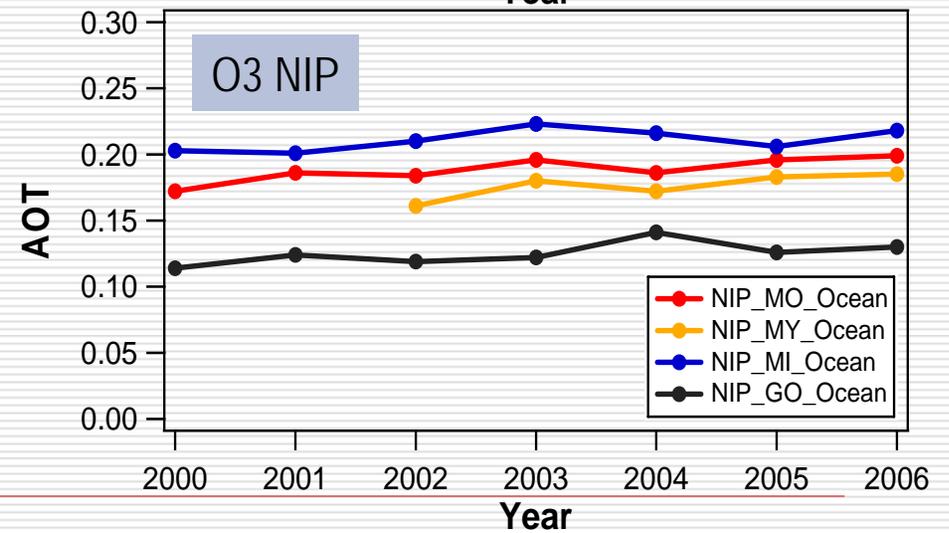

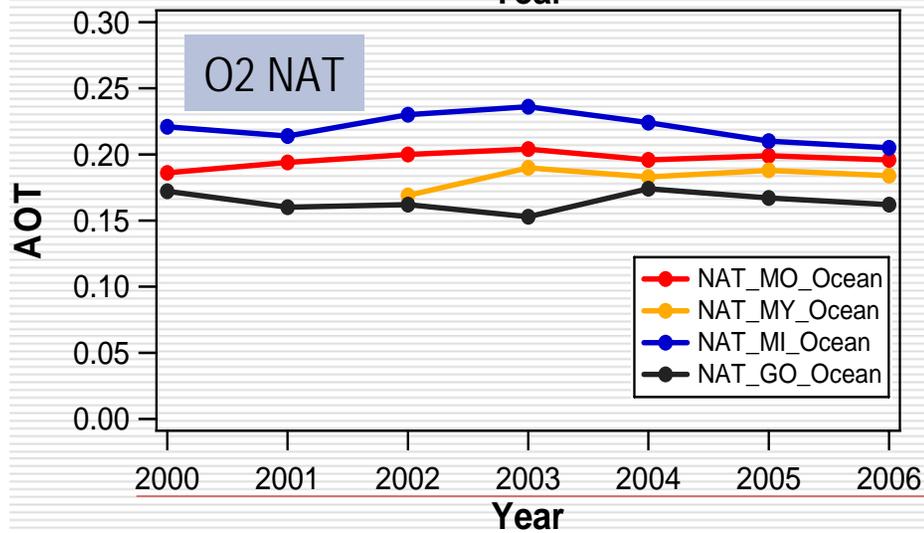

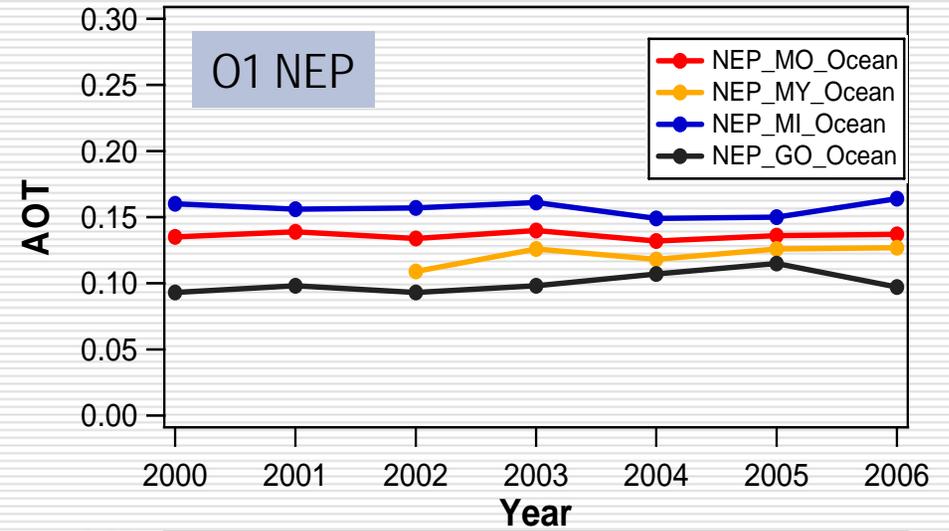

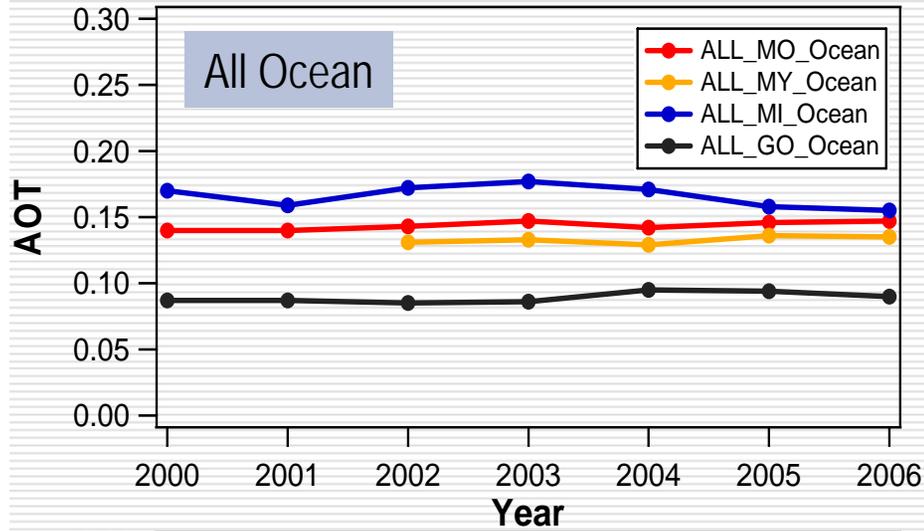

# GOCART composition over land

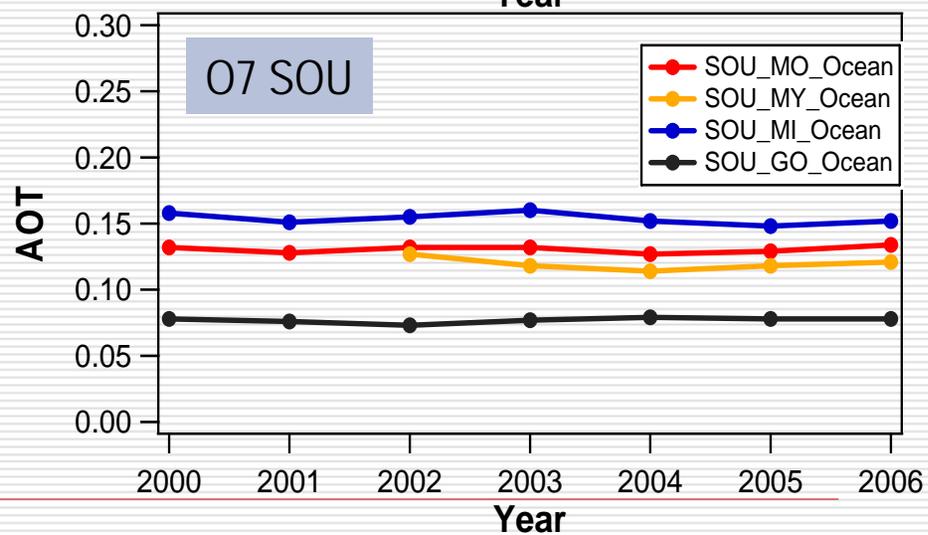

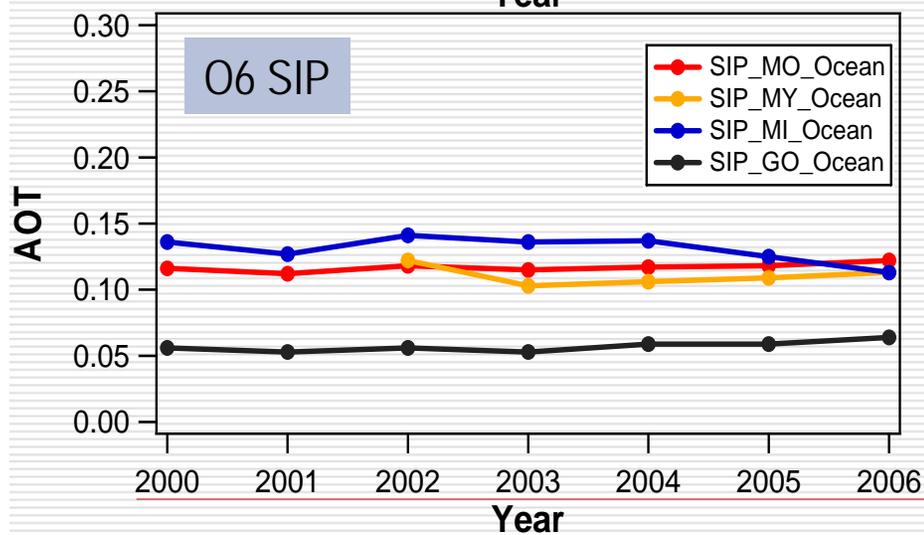

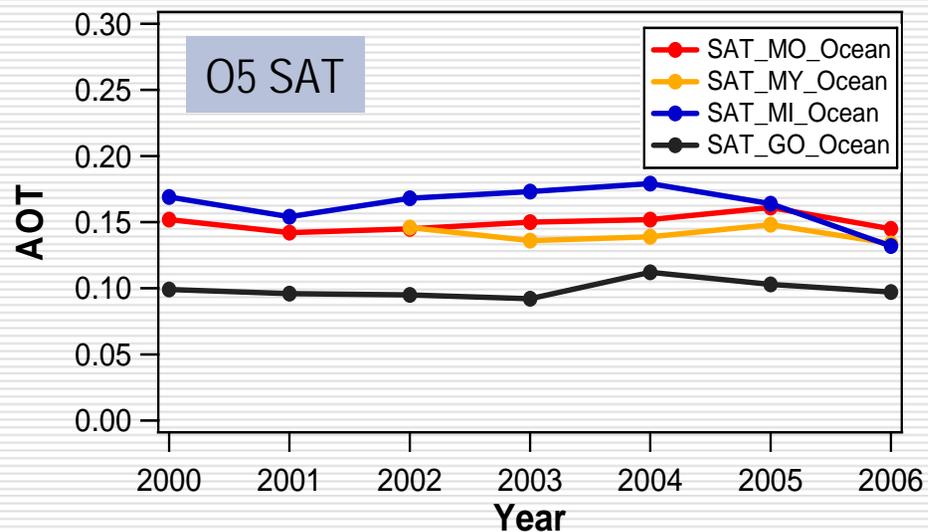

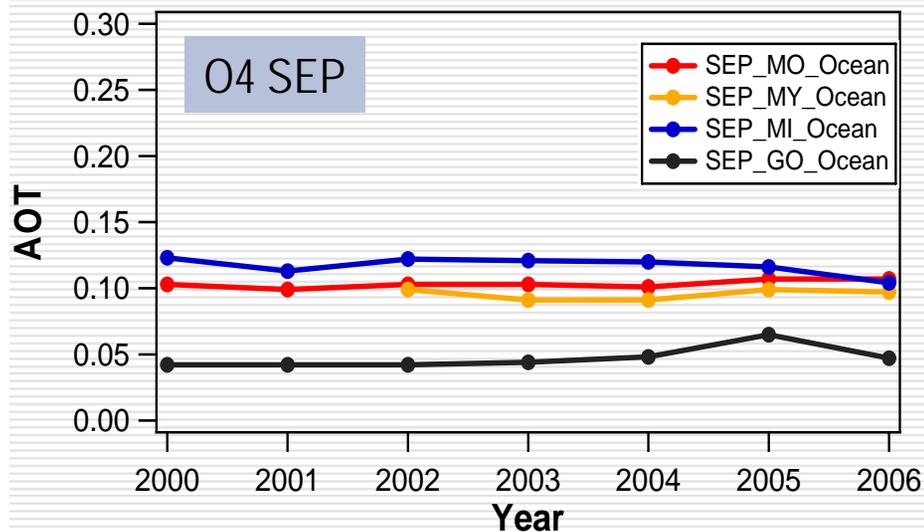

# GOCART composition over ocean

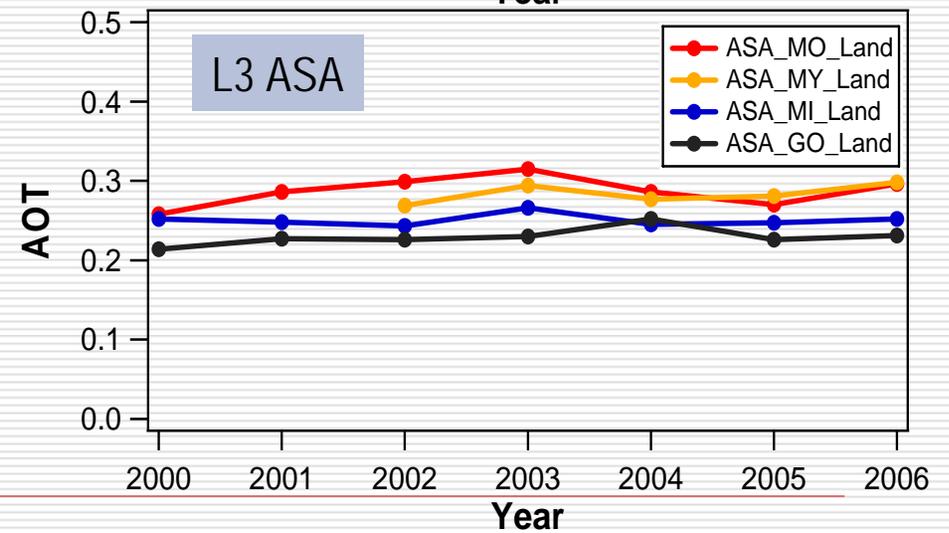

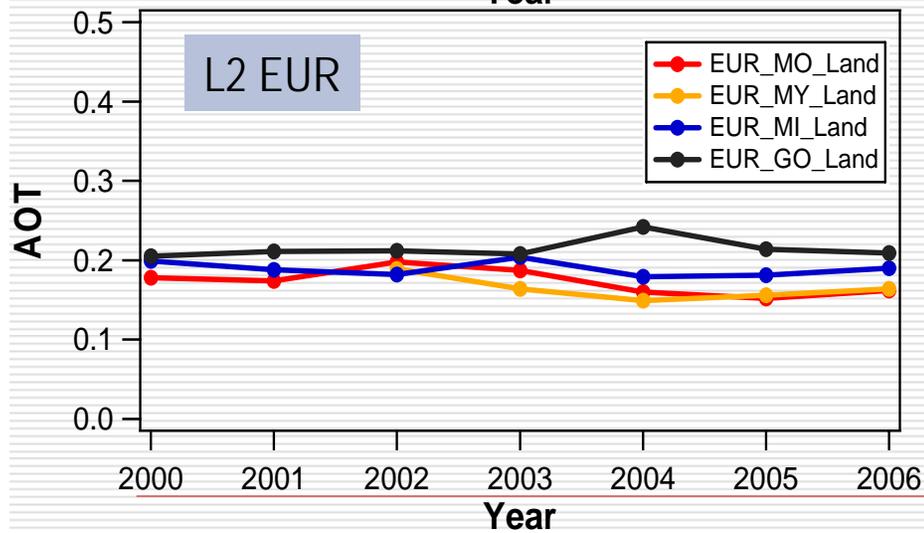

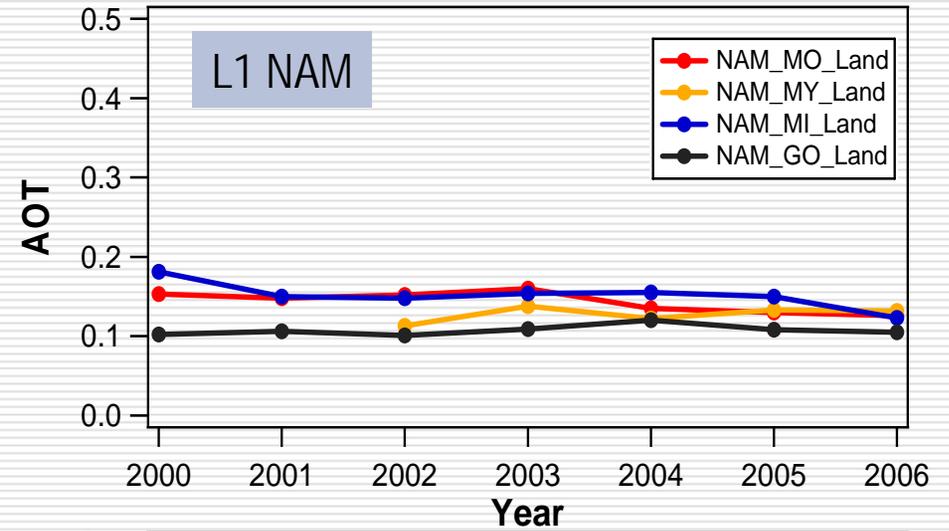

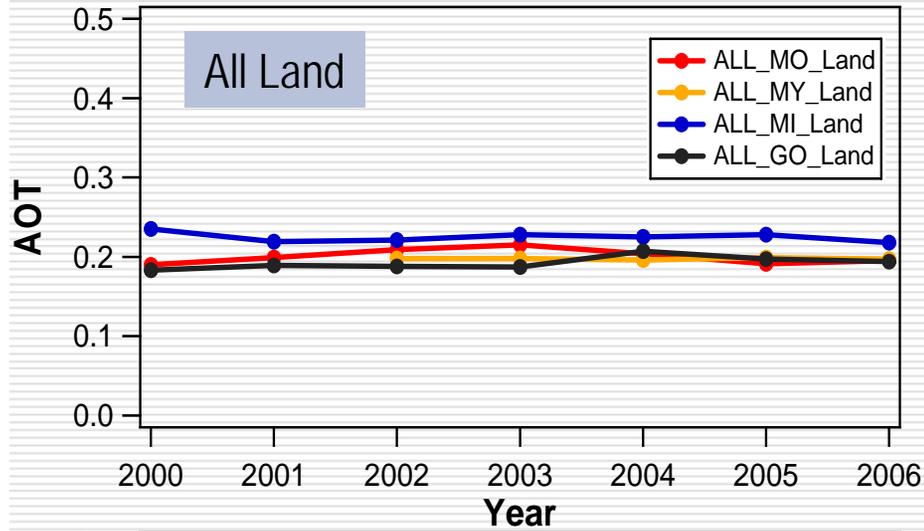

# Ocean region O1 – O3

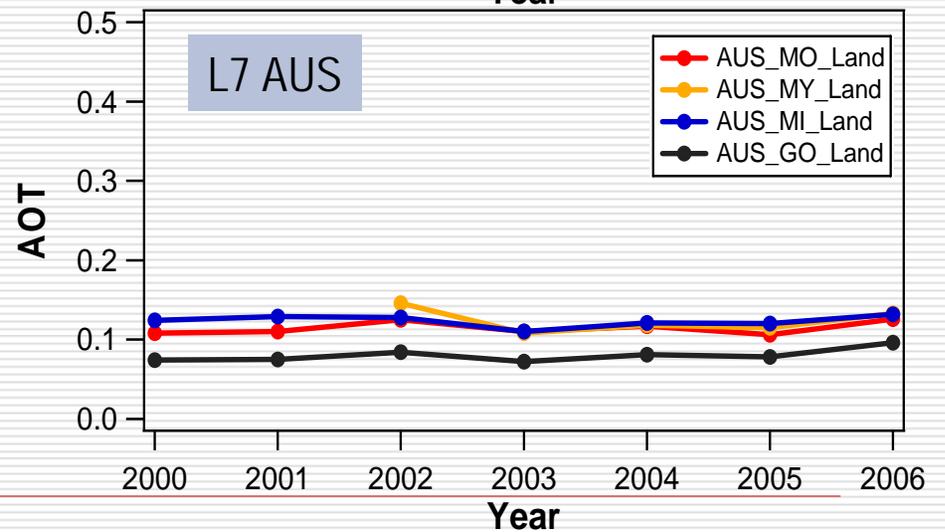

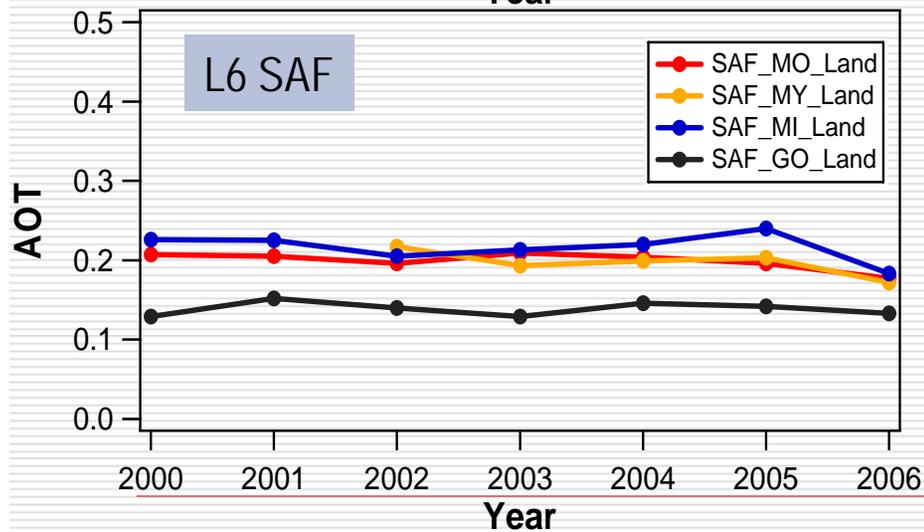

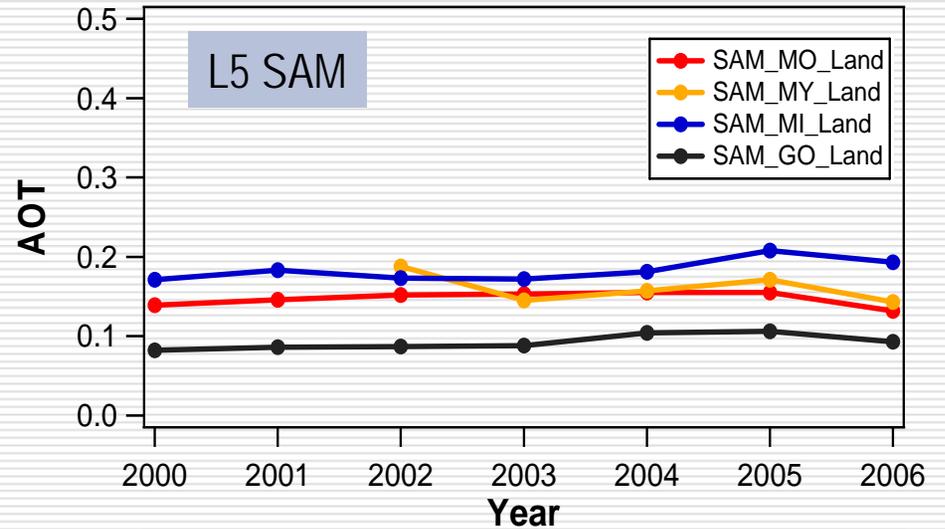

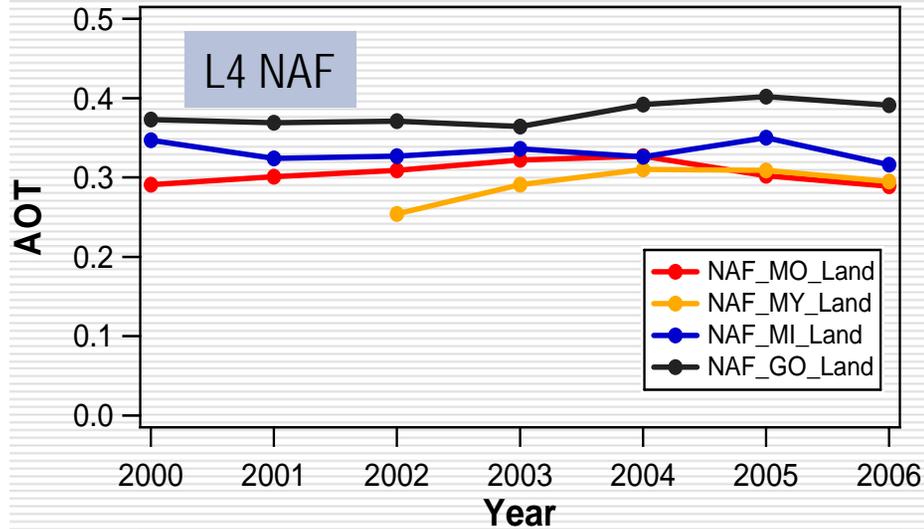

# Ocean region 04 – 07

# Land region L1 – L3

# Land region L4 – L7

Q:

---

- How many models will participate?
  - How should we design regional/global analysis?
  - How do we define regions?
    - According to different economic/emission controlling regions
    - According to different aerosol type regimes
  - Data availability?
    - E.g., GEBA/BSRN
-
