AeroCom participants

Outline

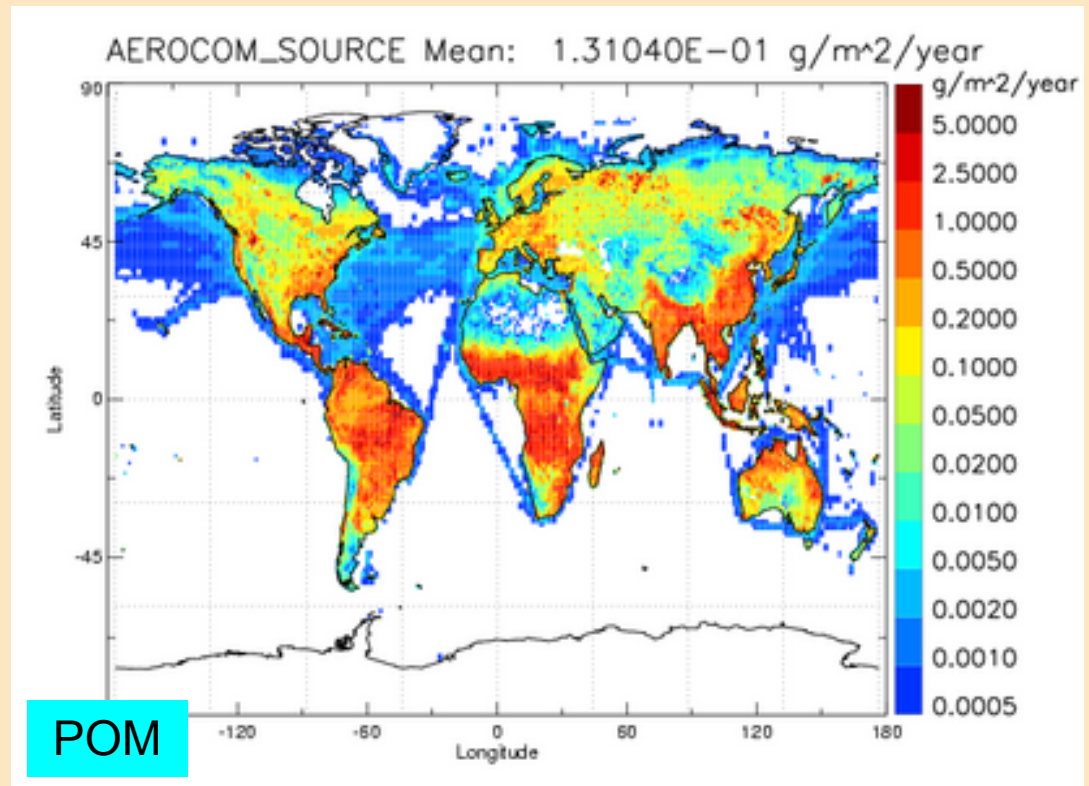

- emissions
- load
- particle sizes
- residence times, removal processes
- composition
- optical properties
- conclusions, outlook

emissions

AeroCom Experiment B

Prescribed emissions:

- 2d/3d fields for dust, sea salt, SO₂, SO₄, DMS, BC, POM
- Particle sizes

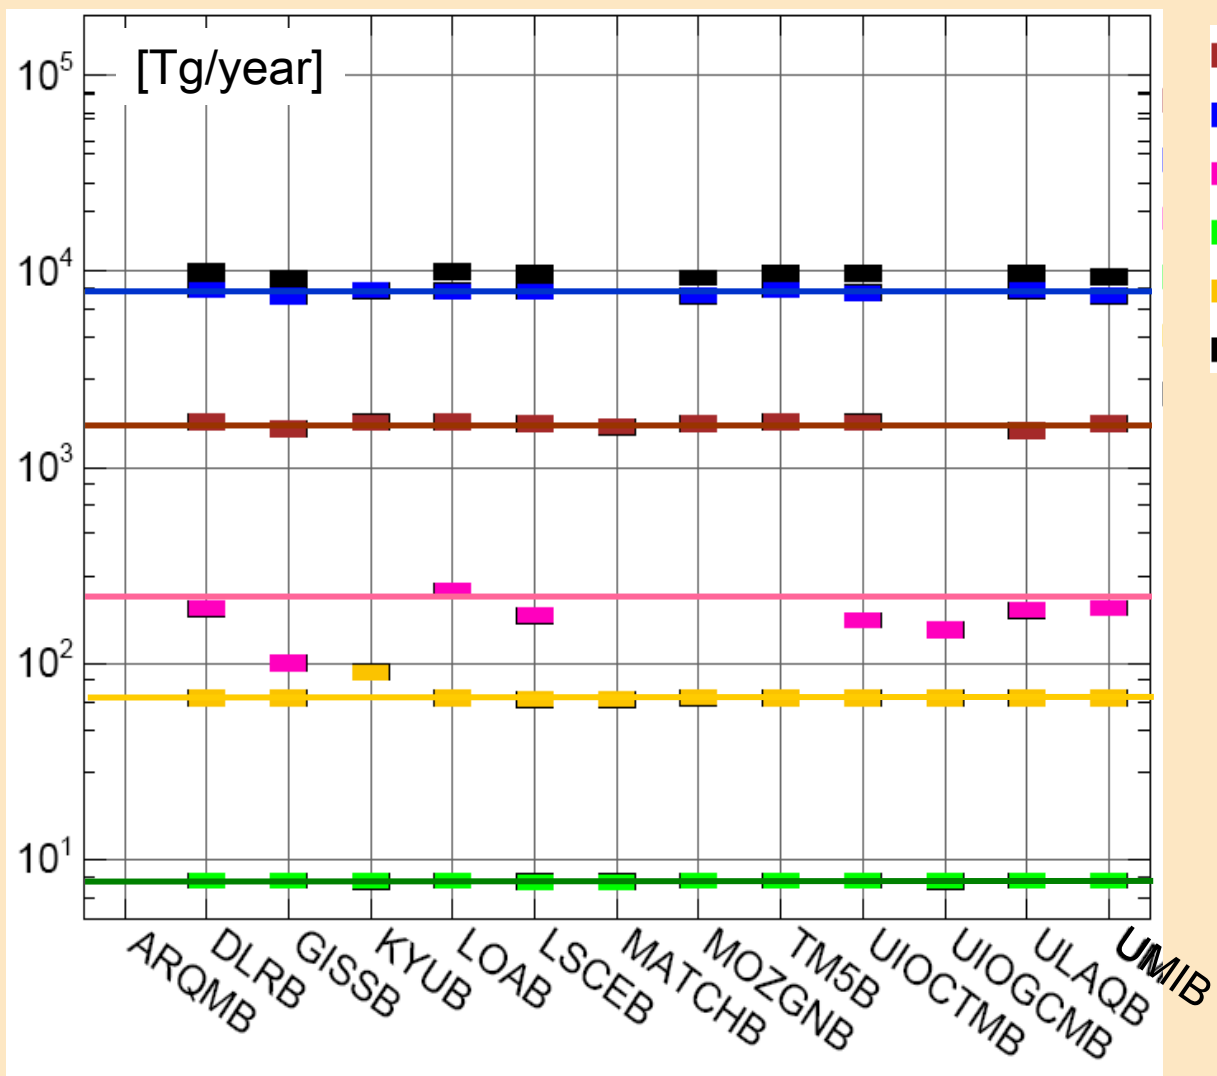

Relative changes in emitted masses Exp B in relation to Exp A

- More SS and DU
- Less BC and POM
- Unchanged SO4

Exp B: „unified“ gobal aerosol emissions

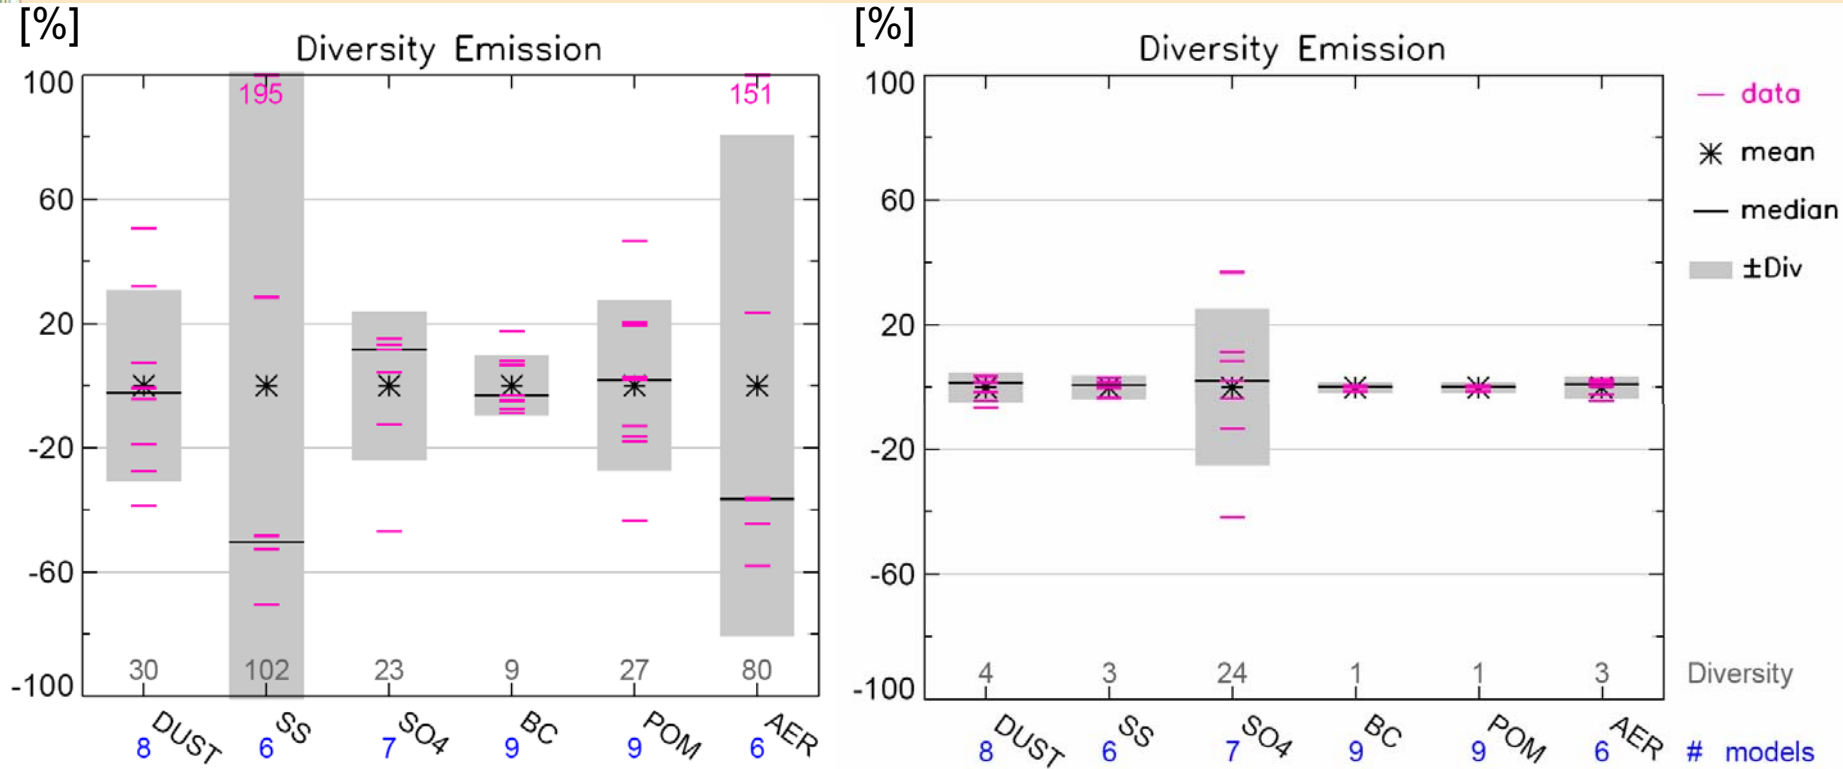

expB: SO₂ + SO₄ + DMS
 models: emi+chep SO₄

AEROCOM B models

SO₄ [TgSO₄/a]

global annual averages
 year 2000 if available

Model diversity of emissions in Exp A and Exp B

$$\text{data} = \frac{\text{model-all models average} * 100}{\text{all models average}}$$

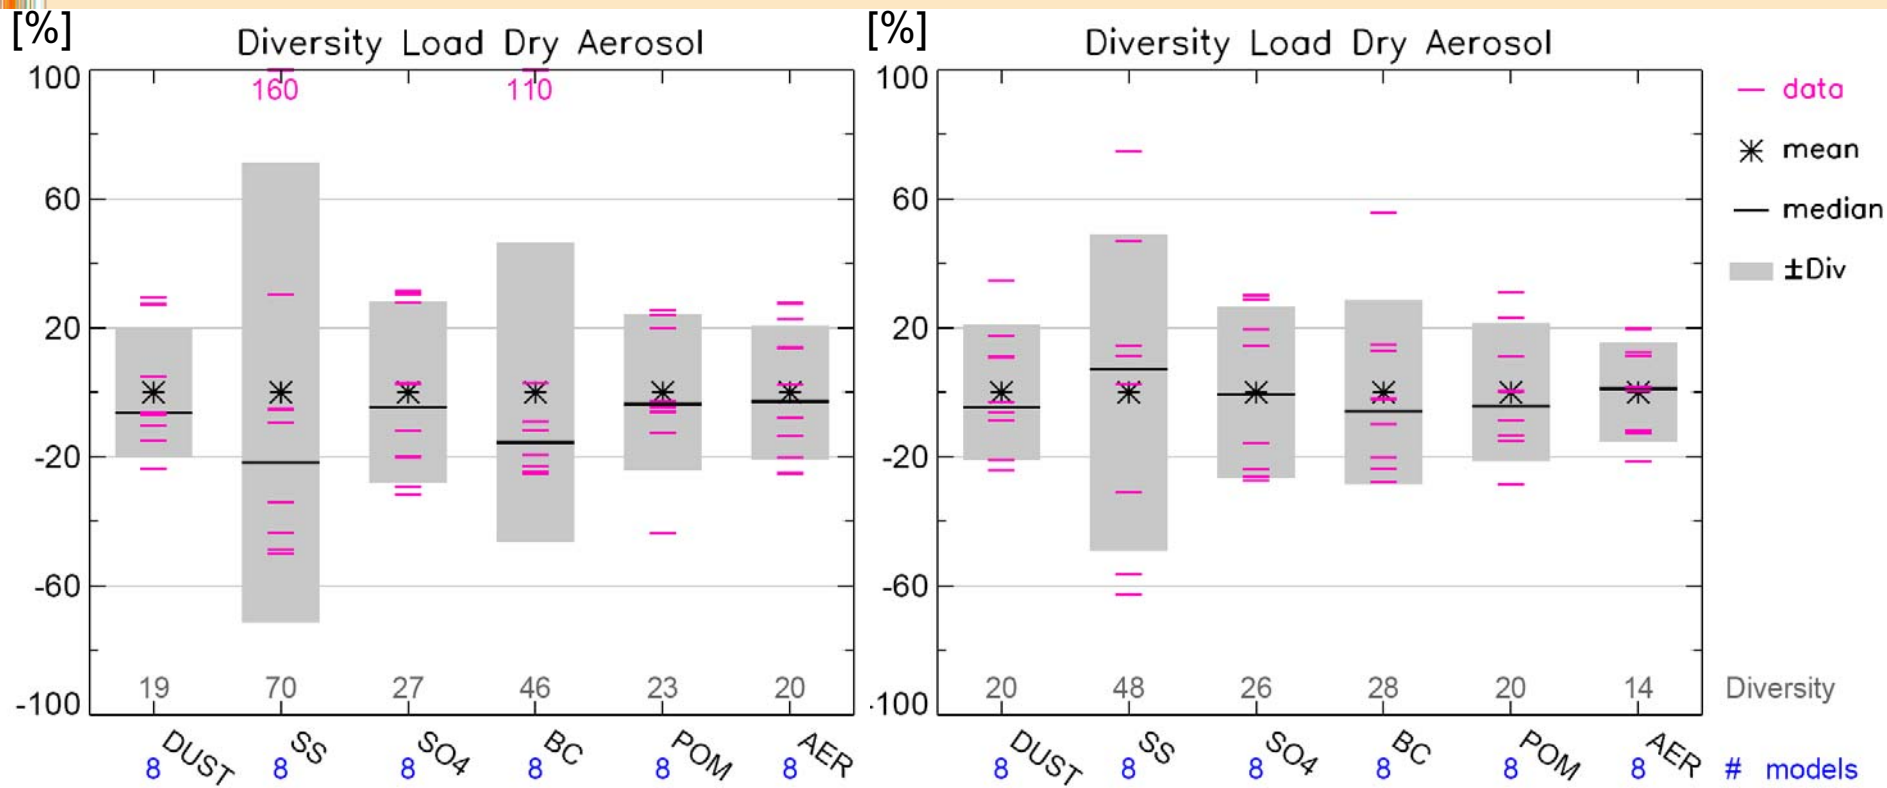

diversity = Standarddeviation of data

global annual averages
year 2000 if available

Differences in model versions in Exp A and B

- KYU indirect effect included,
carbonaceous aerosols:
internal/external mixtures in ExpA/B
- DLR coarse mode included,
updated water uptake (EQSAM)
- LOA no dry deposition for fine aerosols
- MATCH prescribed SS
- UIO_GCM prescribed SS and DU
- ARQM flawed implementation of ExpB emission

Model diversity of total aerosol mass in Exp A and Exp B

Harmonized emissions do not
harmonize aerosol mass !

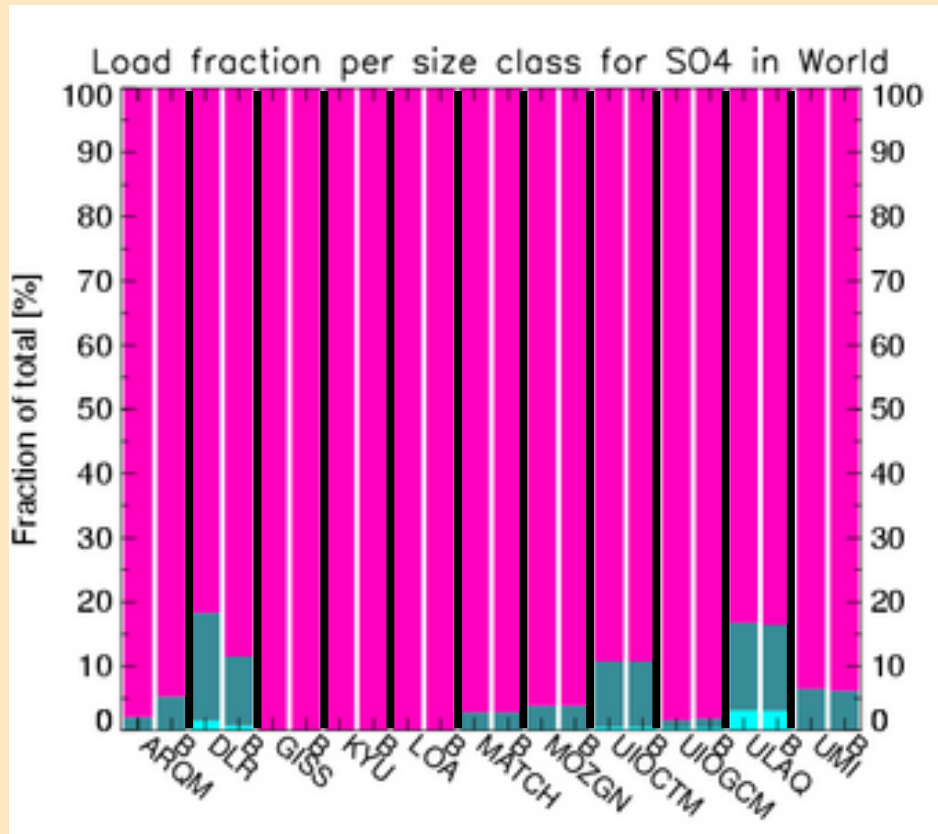

global annual averages
year 2000 if available

Aerocom B emissions: potential problems

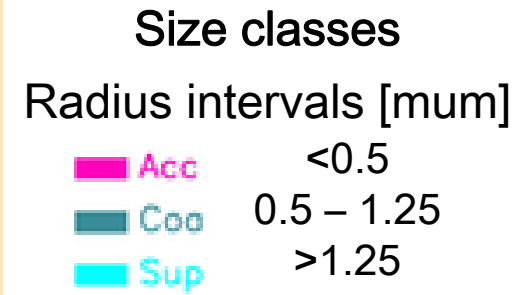

- How are the fields interpolated to the model grid?
- How are the emissions filled into the vertical grid?
- How are the sizes represented?
- Bugs...

particle sizes

Mass fraction per size class in Exp A and B

SO₄

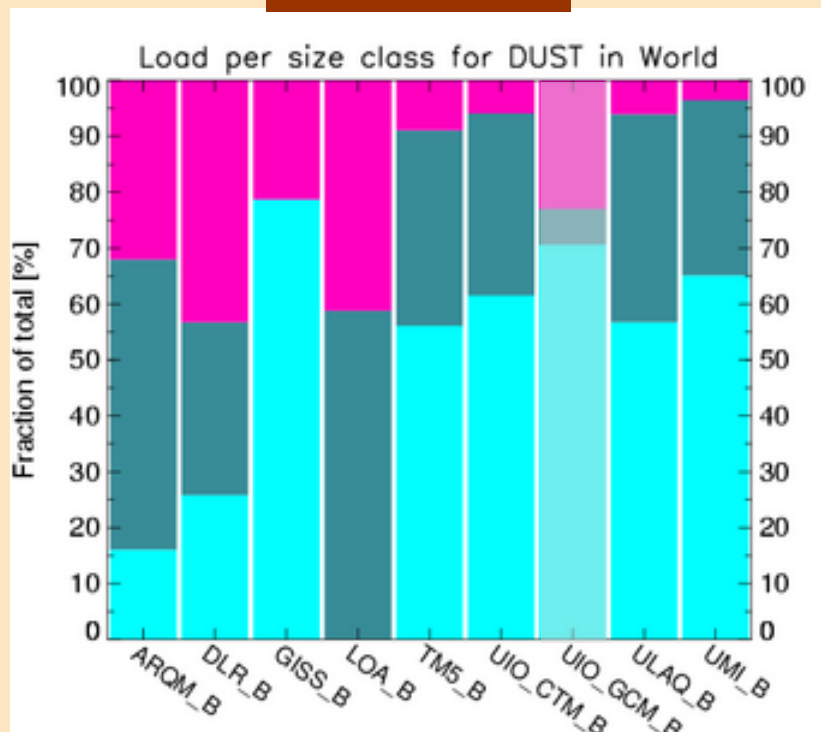

Similar sizes for fine fraction in Exp A and B

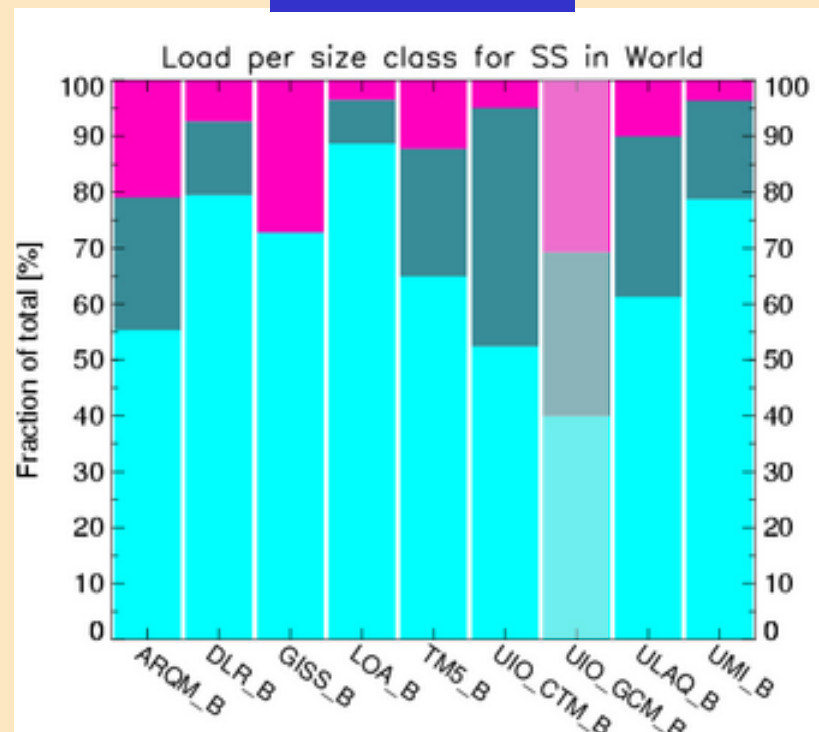

global annual averages
year 2000 if available

Mass fraction / size class in Exp B: DU and SS

DUST

SeaSalt

Unified size (?) of emitted particles is not transmitted to load.

Size classes

Radius intervals [μm]

- Acc <0.5
- Coo 0.5 – 1.25
- Sup >1.25

Mass fraction per size class in Exp A and B

DUST

SeaSalt

- Particle size is similar for a given model for both experiments.
- Different representation of sizes in schemes?
- Deficiency of AeroCom diagnostics?

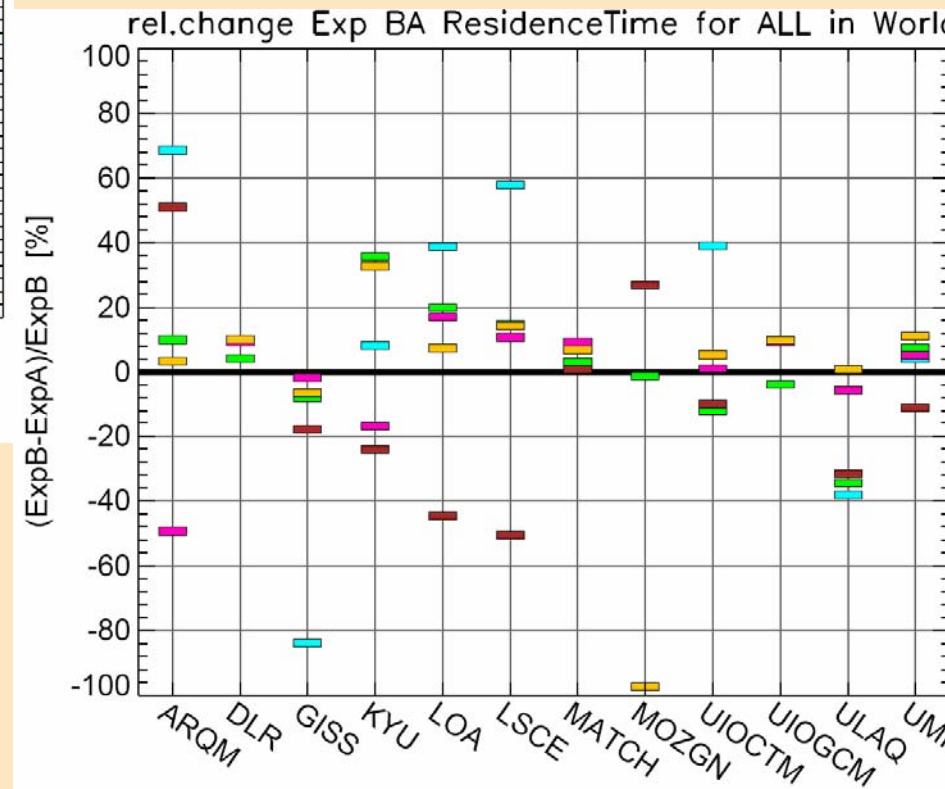

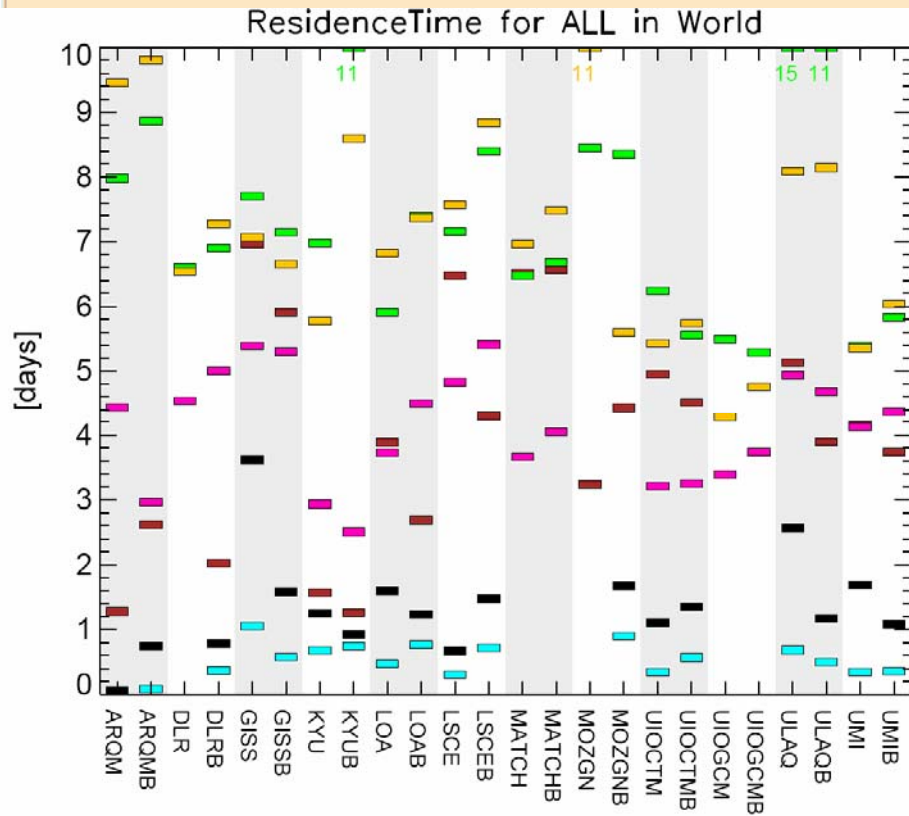

Size classes

Radius intervals [μm]

- Acc <0.5
- Coo 0.5 – 1.25
- Sup >1.25

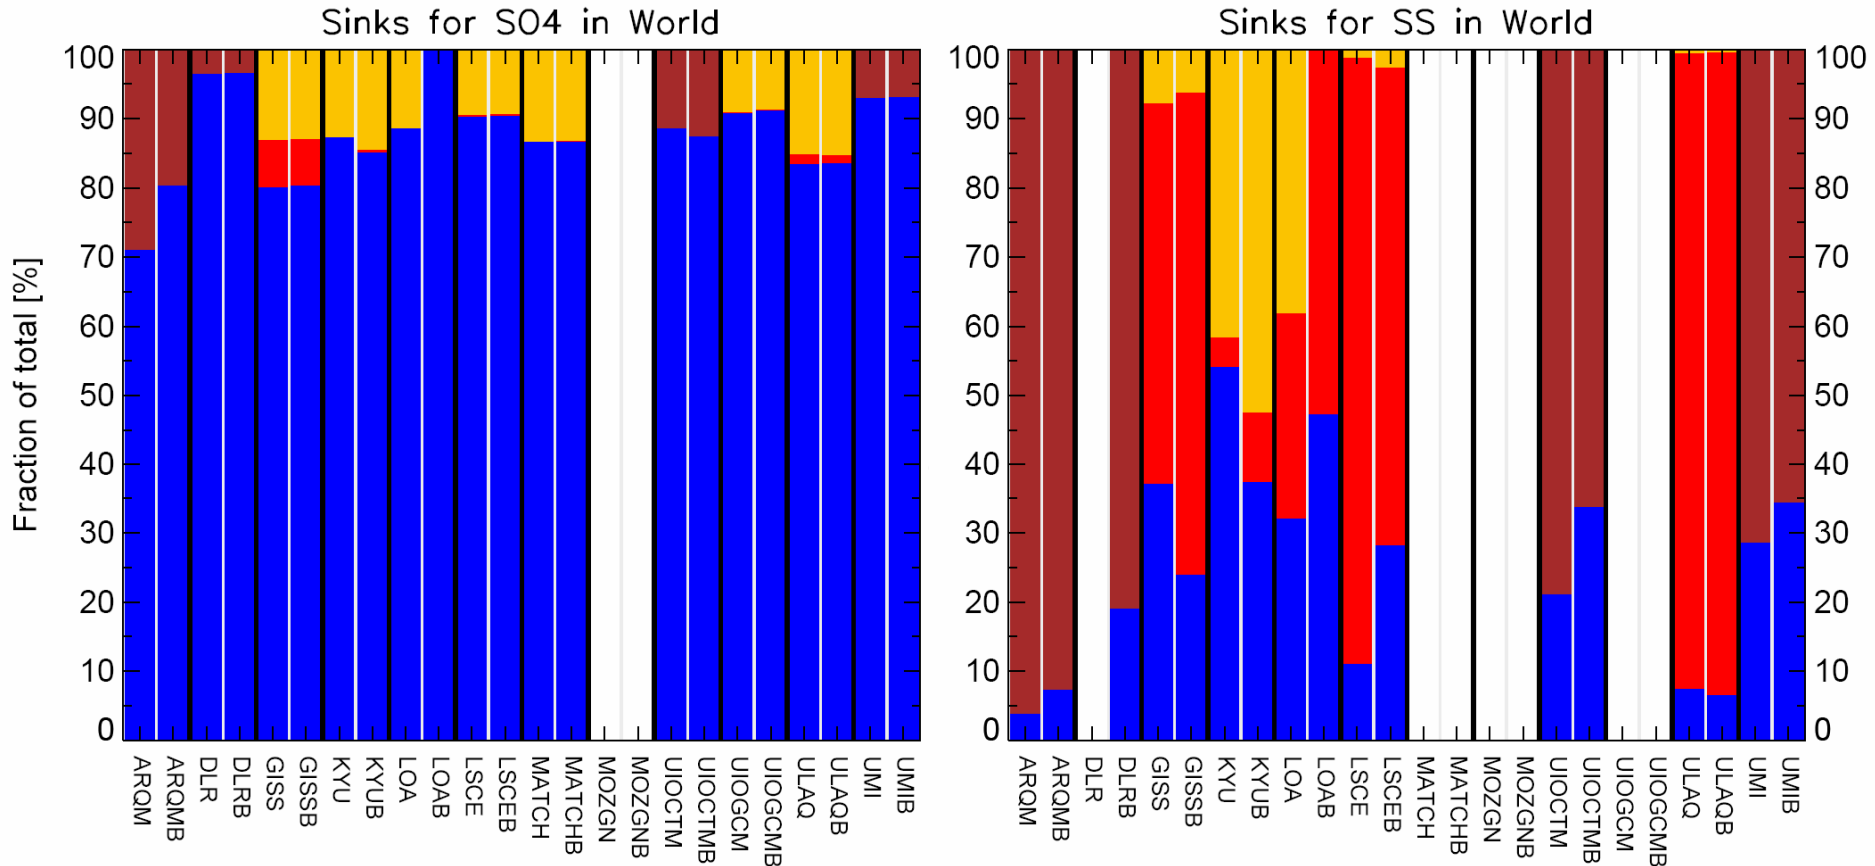

Residence times

Residence times in Exp A and B

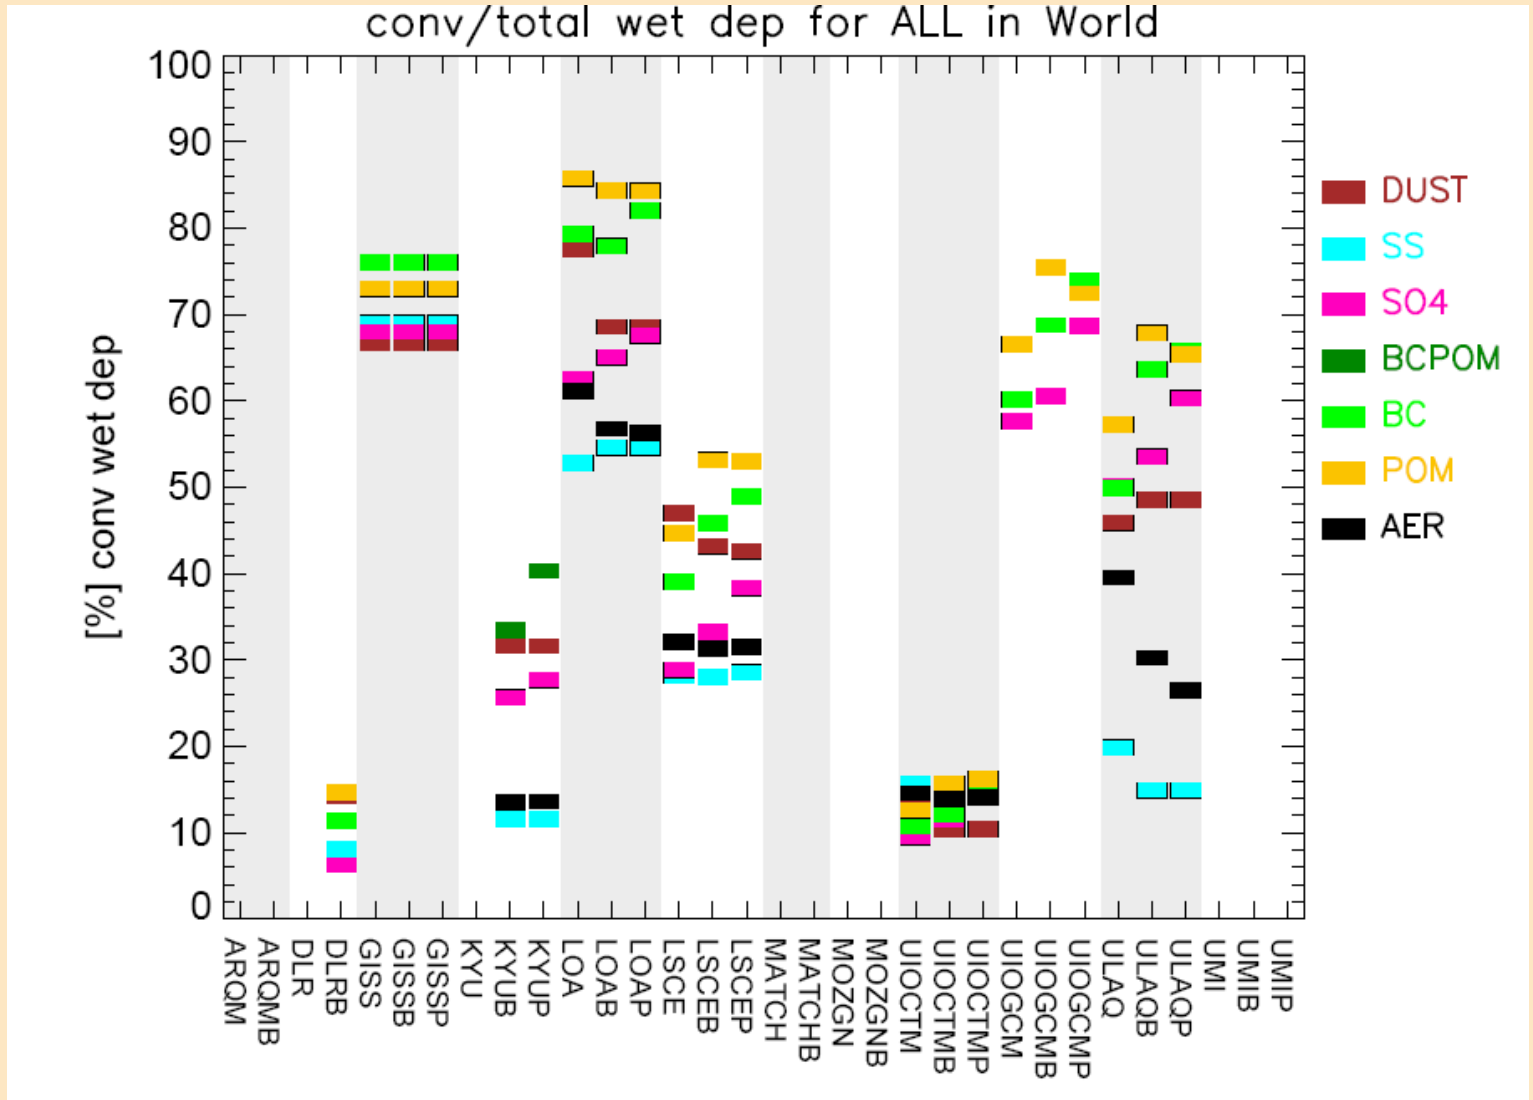

Effects of modified spatial distributions and particle sizes.

Split of Removal pathways

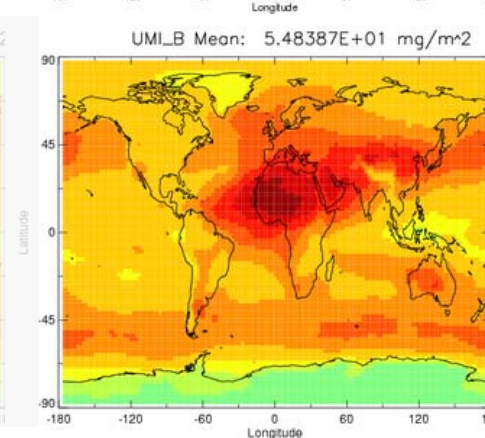

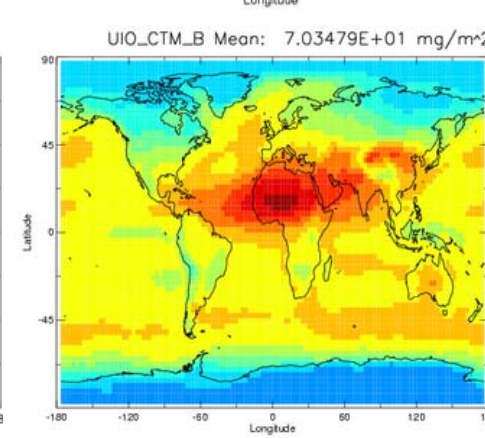

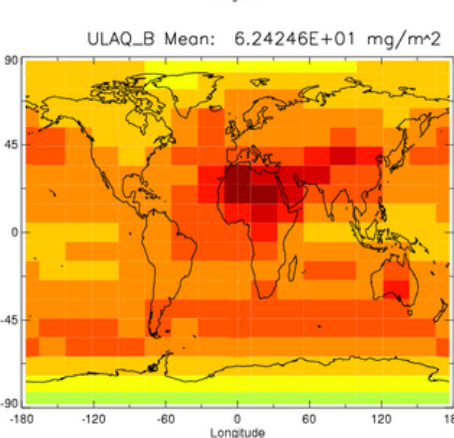

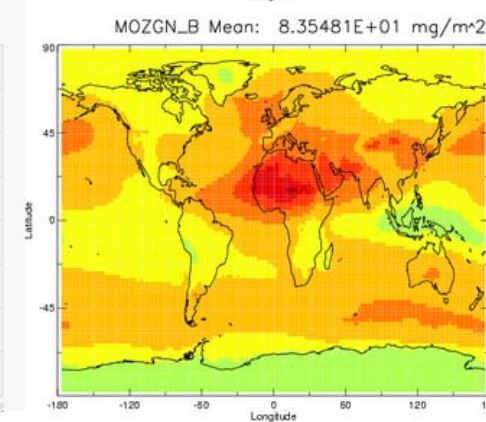

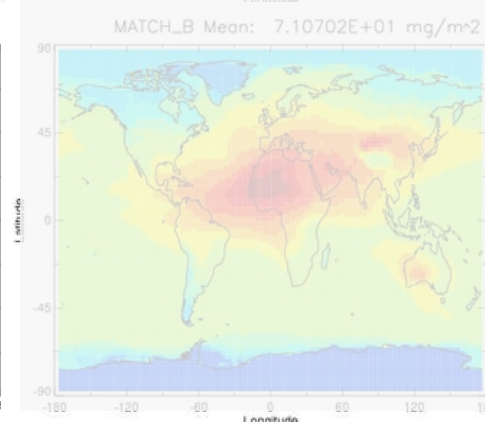

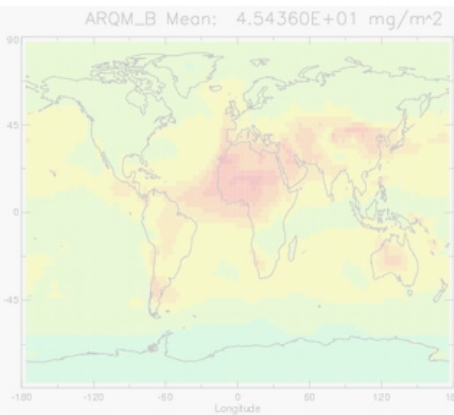

Results of the two exp's are more similar for a given model than for a given experiment.

Split between stratiform and convective wet deposition

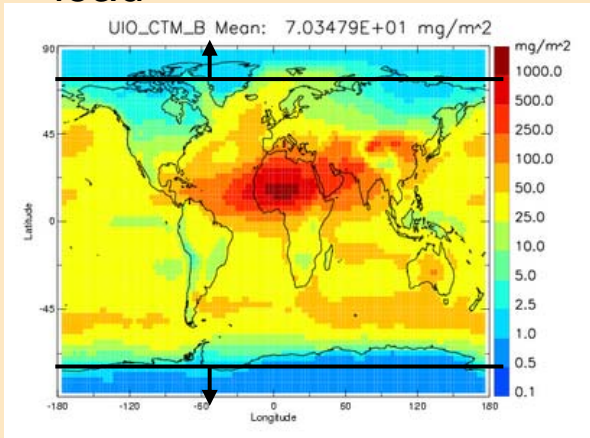

simulated spatial aerosol distributions

Aerosol load in Exp B [mg/m^2]

Meridional distribution of Aerosols

load

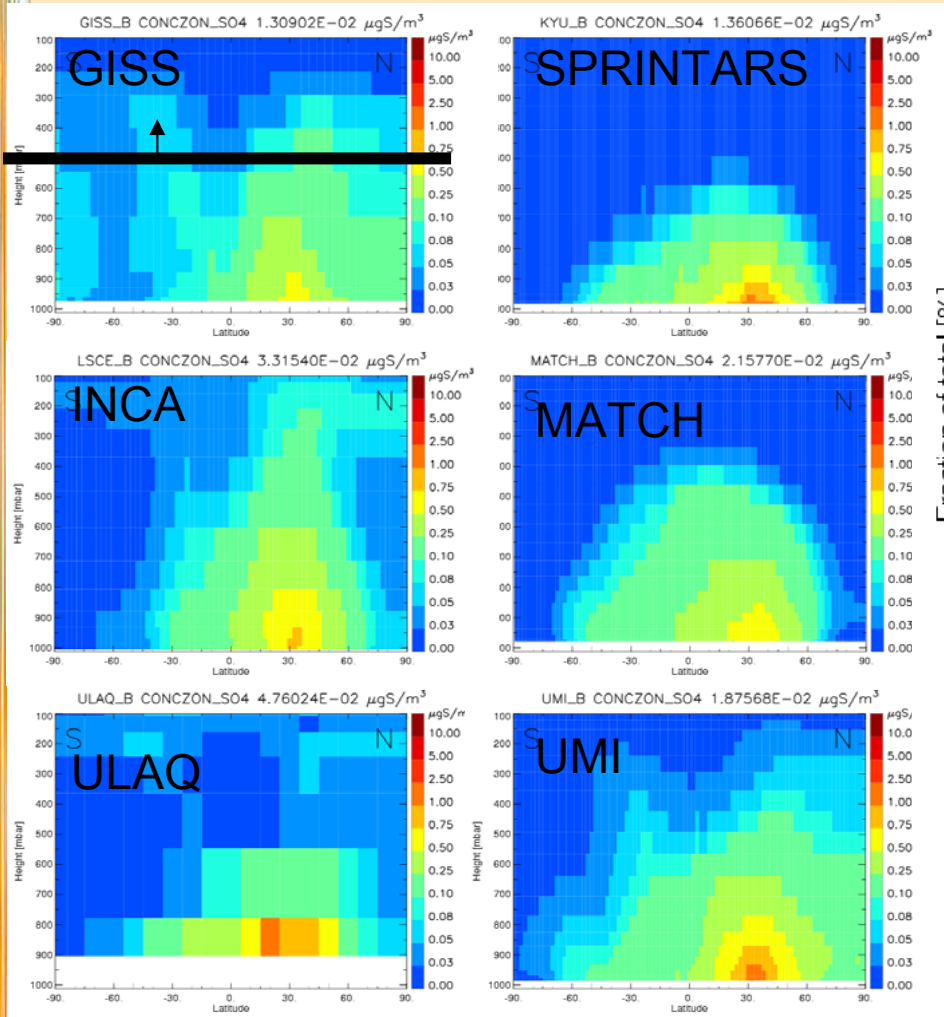

Mass fractions for components in polar region (>80 degree)

... is model specific

Vertical distribution of Aerosols

SO4 zonal concentration

Mass fractions for components above 5 km height

PRE=AeroCom 1750
 B=AeroCom emissions 2000
 A=original model

... is model specific

composition

Composition

contribution to total mass per component

Dry aerosol

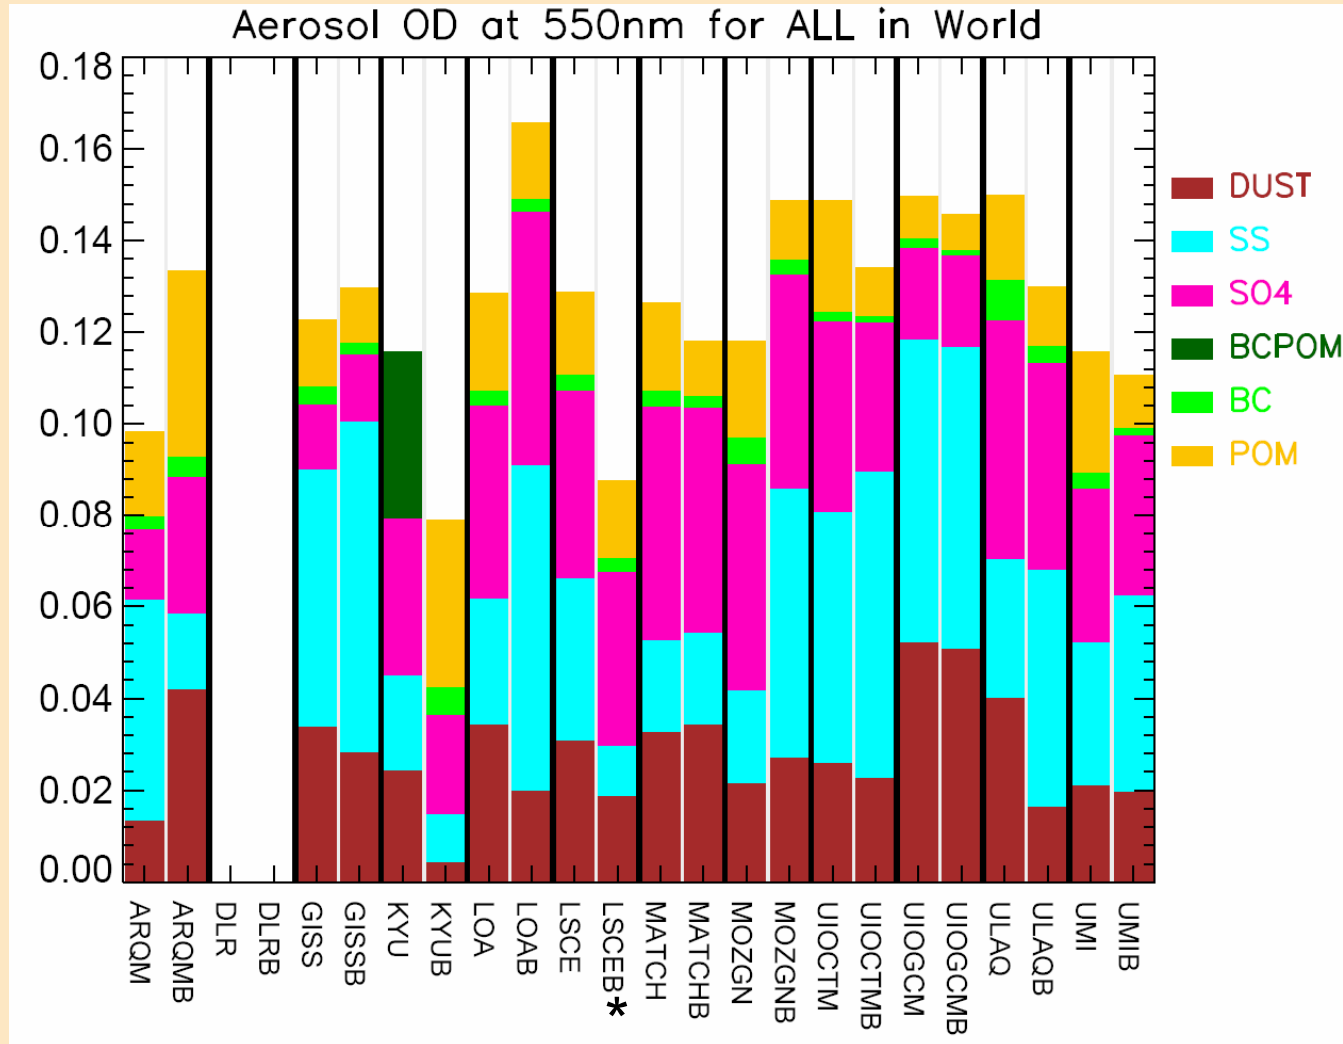

Ambient aerosol

Optical properties

Aerosol Optical Depth per component

Aerosol Optical Depth

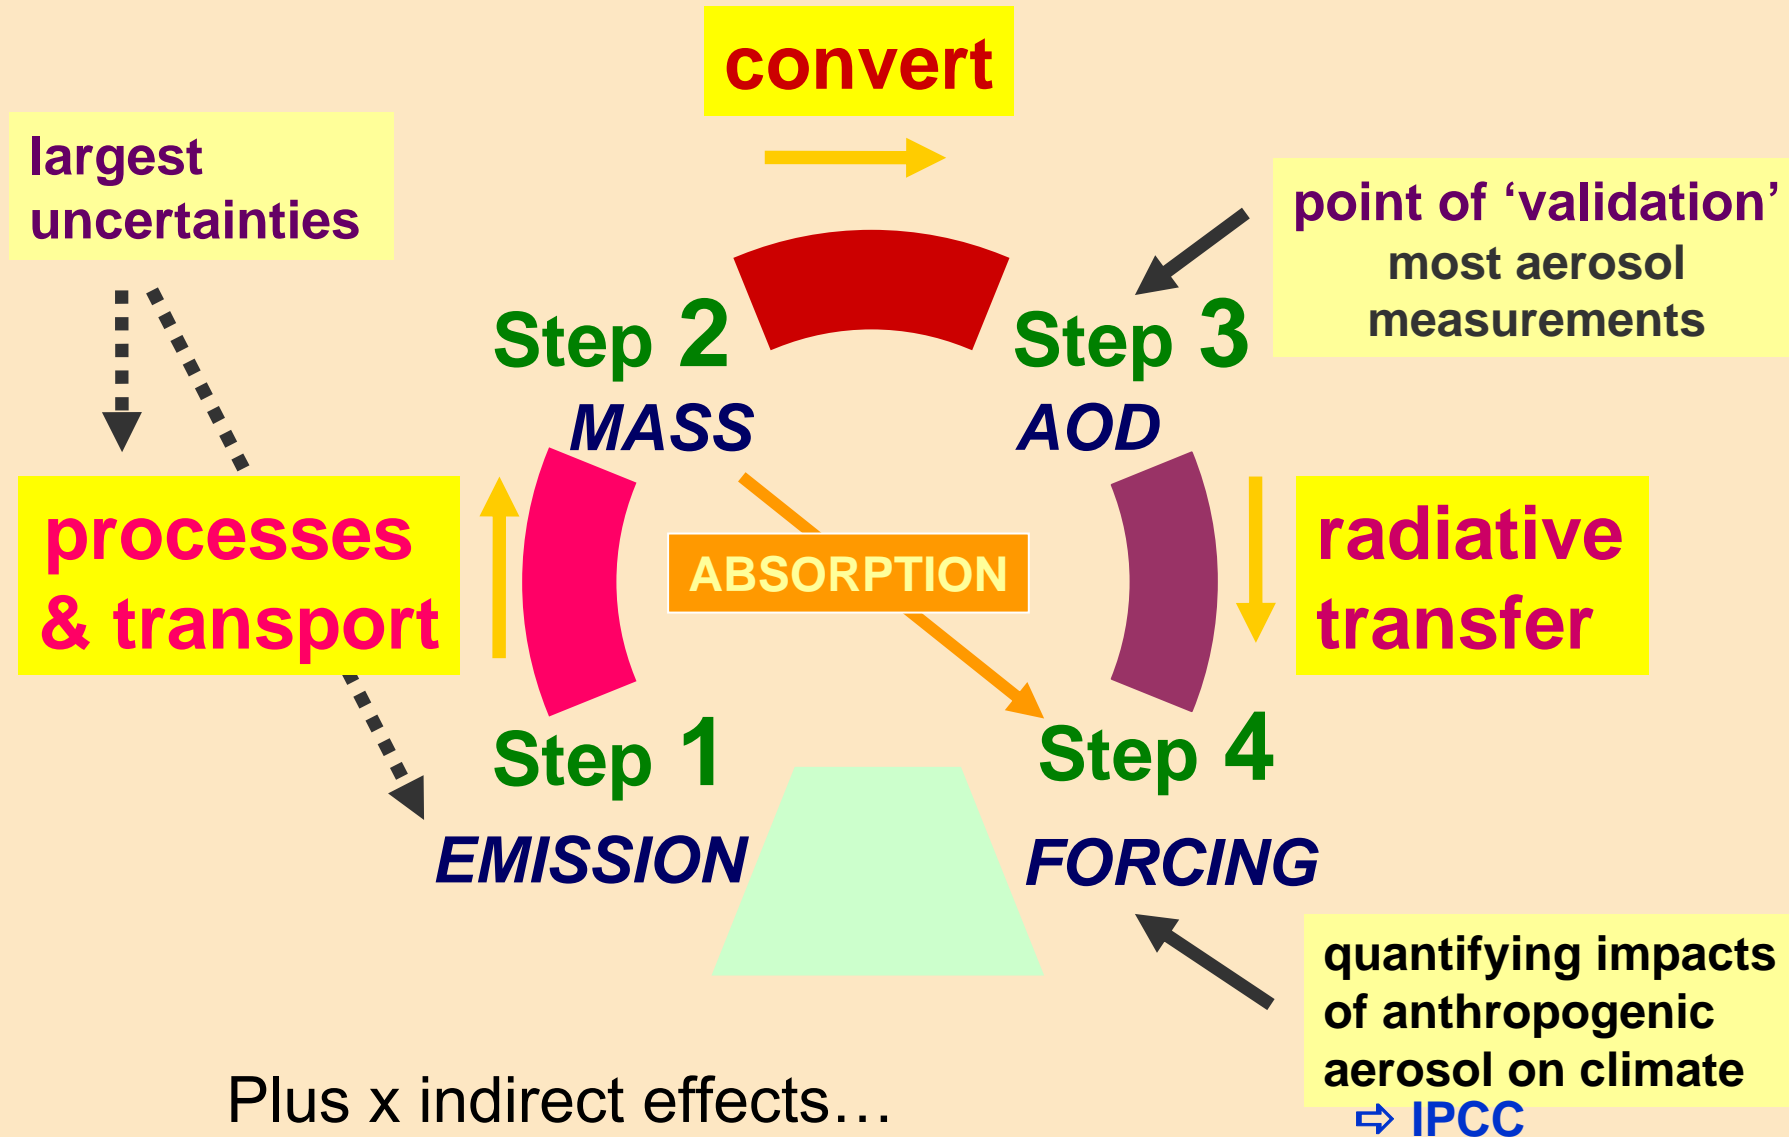

Harmonized emissions do not harmonize aerosol optical depth !

Conclusions

- Implementation of prescribed aerosol (precursor) sources is not straightforward.
- The diversity among model results is about the same in both experiments.
- Harmonizing emissions has only a small impact, models are 'pre-wired'.
- Aerosol microphysics is not the only problem.
- Important implications for pollution abatement strategies inferred from such model results.

Outlook: Modeling of aerosols - a “ 4 Step process ”

THANK YOU !

The aerosol life cycle

inter-dependence of
internal aerosol processes
and **transport** provided by
the global model

Sink processes analysis

The rates differ between the species:

➤ **wet removal rates**

increase with the solubility
from DU, BC, POM to SO₄ and SS.

➤ **dry removal rates**

increase with the particle sizes.

➤ **main removal processes**

BC, POM to SO₄: > 80% wet dep.

DU and SS: ~66% dry dep.

Why do the removal rates for a given species differ between the models ?

Removal rate vs vertical dispersal

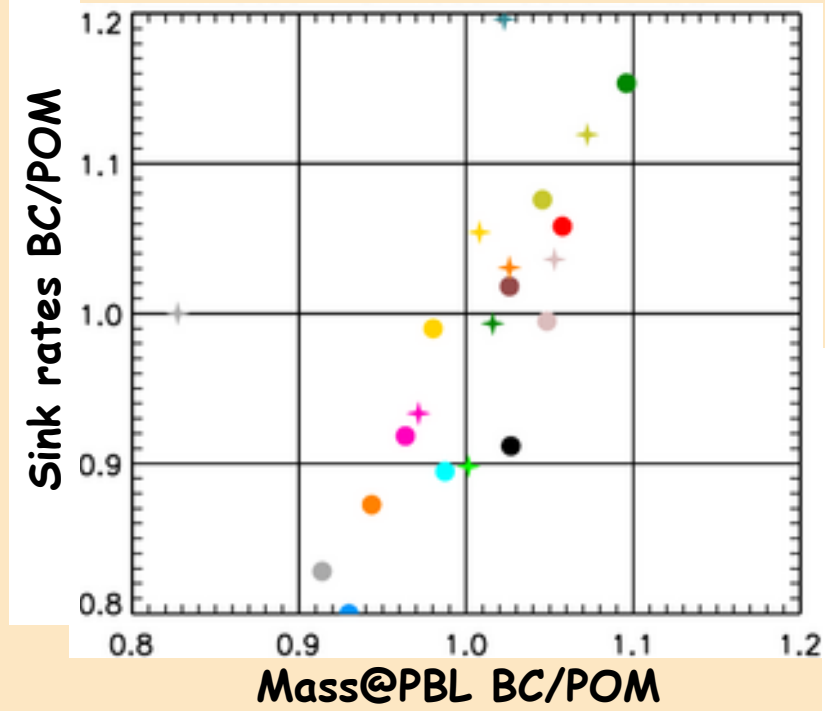

Faster sink rate for BC than for POM

Wet dep rate BC vs POM

Ratios BC/POM:
sink rates vs mass in PBL

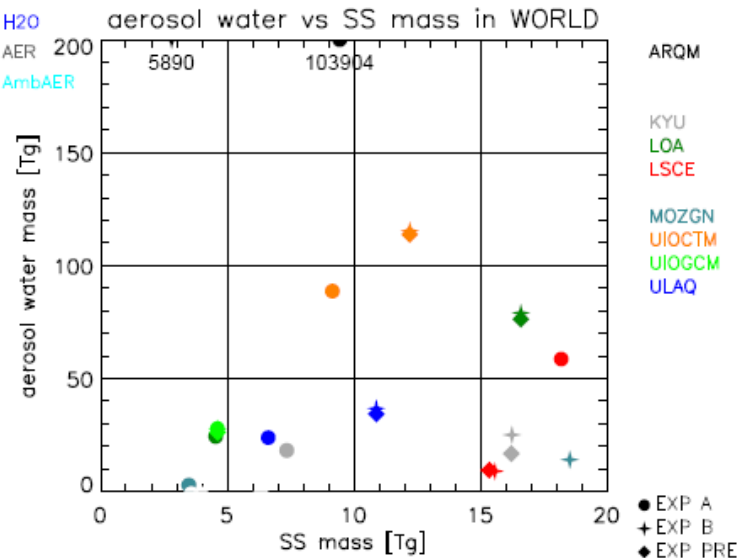

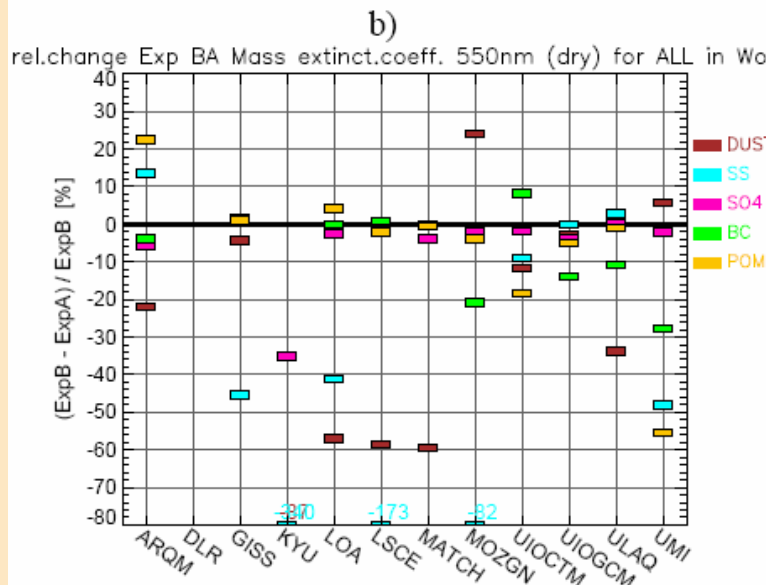

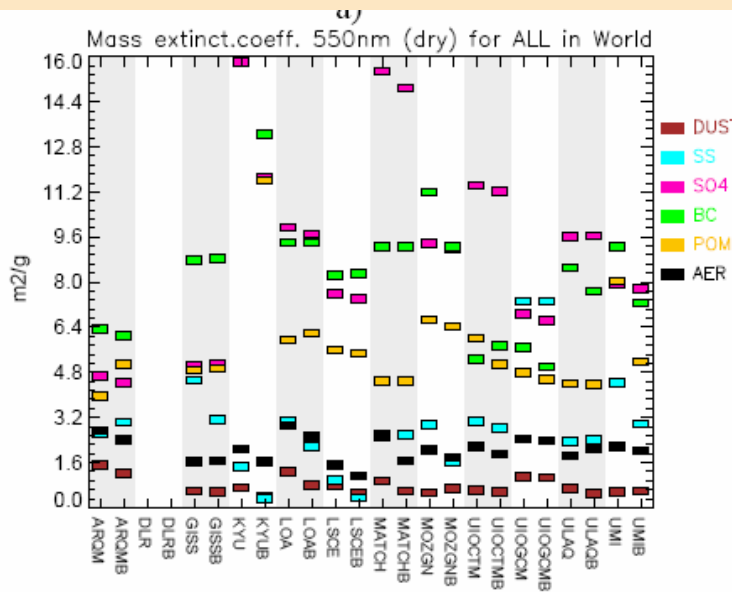

Fig. 11. a) Global annual mean mass of dry aerosol (Dust, AER) and of aerosol water (H₂O) and ambient aerosol

Mass Extinction coefficient

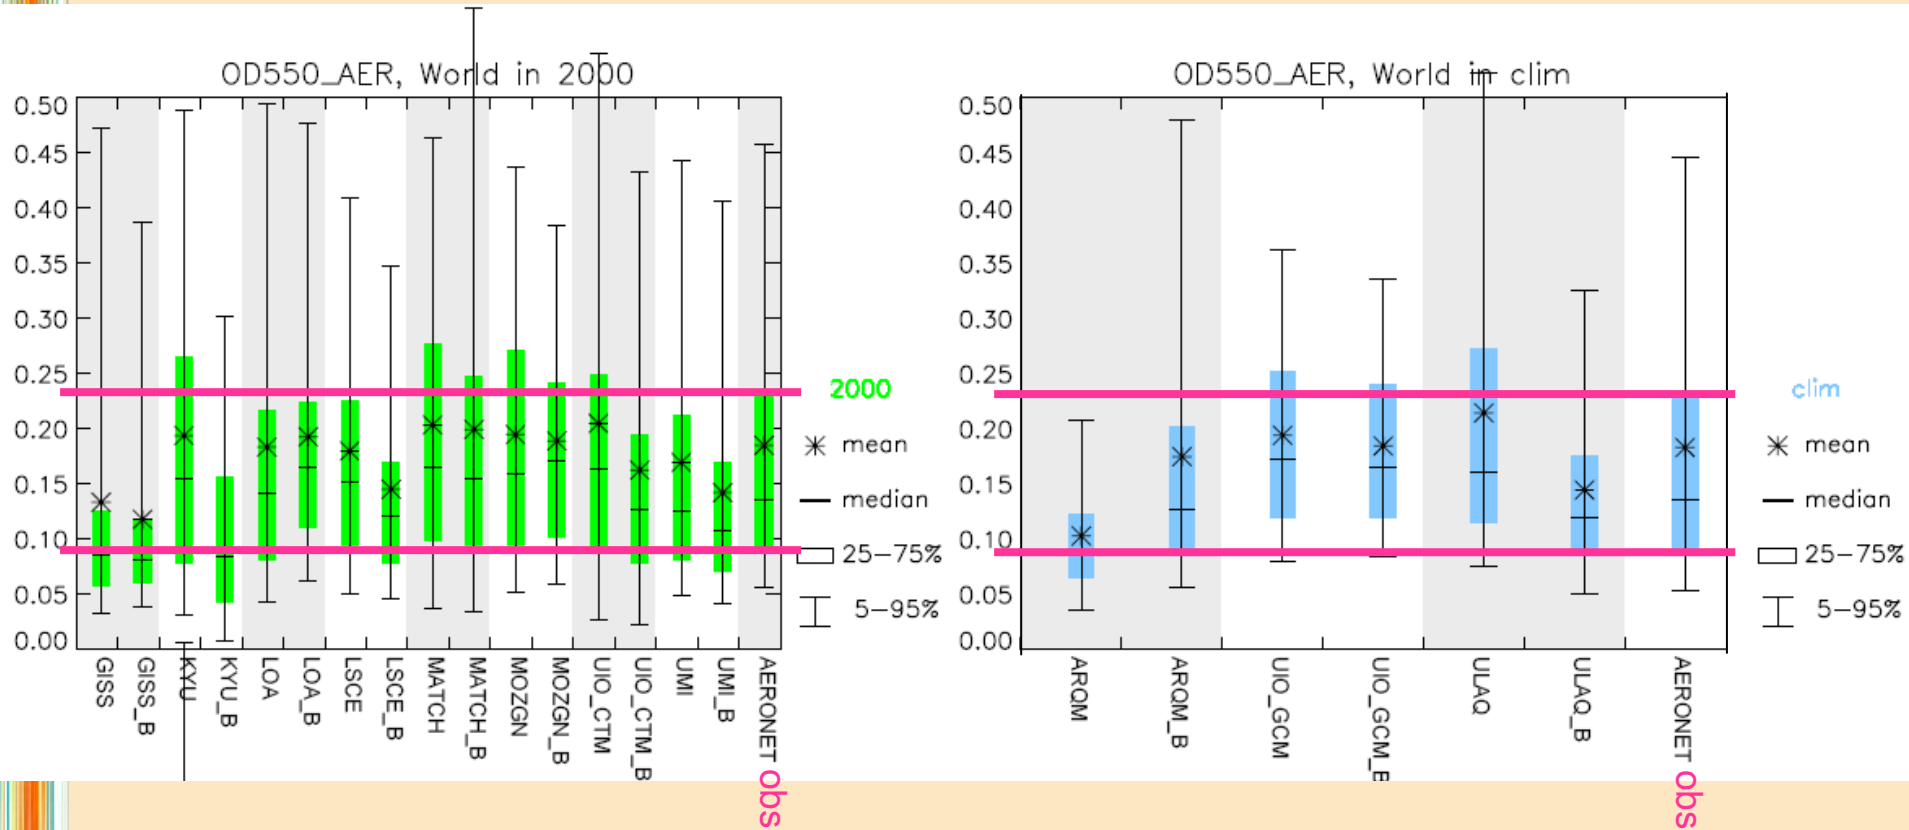

MEC

= AOD₅₅₀

/dryload

= $3 \cdot \text{opt_prop} / (4 \cdot \rho \cdot r_{\text{eff}}) \cdot (\text{water} + \text{dryload}) / \text{dryload}$

Comparison to Observations

Exp B

- Smaller AOD due to smaller anthropogenic emissions
- Better match to obs
