email: Jens.Redemann-1@nasa.gov

Motivation:

- 1) Quantifying anthropogenic aerosol radiative forcing (historical or future) of climate requires climate models.
- 2) Models show large spread in (even) clear-sky direct aerosol radiative forcing of climate.
- 3) Need to test the models with observations of the most closely related quantity = present-day total (anthropogenic plus natural) Direct Aerosol Radiative Effect (DARE)

- Motivation
- Approach
- Retrieval choices
- Results
 - AOD & SSA distributions
 - SSA comparison with AERONET
 - Comparisons to AeroCom Phase 2
 - Uncertainties in observational DARE
 - Assessment of DARE uncertainties due to sampling
- Seasonal mean $DARE_{\text{clear-sky}}$
- Conclusions

* Subset of AeroCom Phase 2 models with SW fluxes and no-aerosol runs stored

Approach: use A-Train aerosol obs to constrain aerosol radiative properties and to calculate observationally-based DARE and its uncertainty

Constraints/Input:

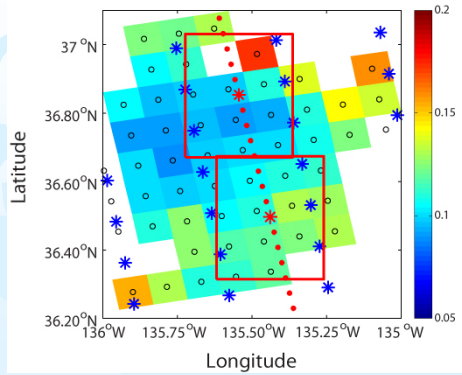

- MODIS AOD (550, 1240 nm) ± (0.03+5%)
- OMI AOD (388 nm) ± (0.05+30%)
- CALIPSO ext (532, 1064 nm) + δ_{ext}
- CALIPSO back (532 nm) ±(0.1 Mm⁻¹sr⁻¹+30%)

Aerosol models:
 7 fine and 3 coarse mode models and refractive indices for bi-modal log-normal size distribution → 100 combinations
 Free parameters: N_{fine}, N_{coarse}

Rtx code

Target:
 $\Delta F_{aerosol}(z) + \delta \Delta F_{aerosol}(z)$

Comparison:
 AERONET AOD, SSA, g
 Airborne test bed data

Retrieval:
 ext (λ, z) + δ_{ext}
 SSA (λ, z) + δ_{SSA}
 g (λ, z) + δ_g

Comparison:
 CERES F_{clear}
 Airborne F_{clear}

- Motivation
- Approach
- Retrieval choices
- Results
 - AOD & SSA distributions
 - SSA comparison with AERONET
 - Comparisons to AeroCom Phase 2
 - Uncertainties in observational DARE
 - Assessment of DARE uncertainties due to sampling
 - Seasonal mean DARE_{clear-sky}
 - Conclusions

Retrieval choices

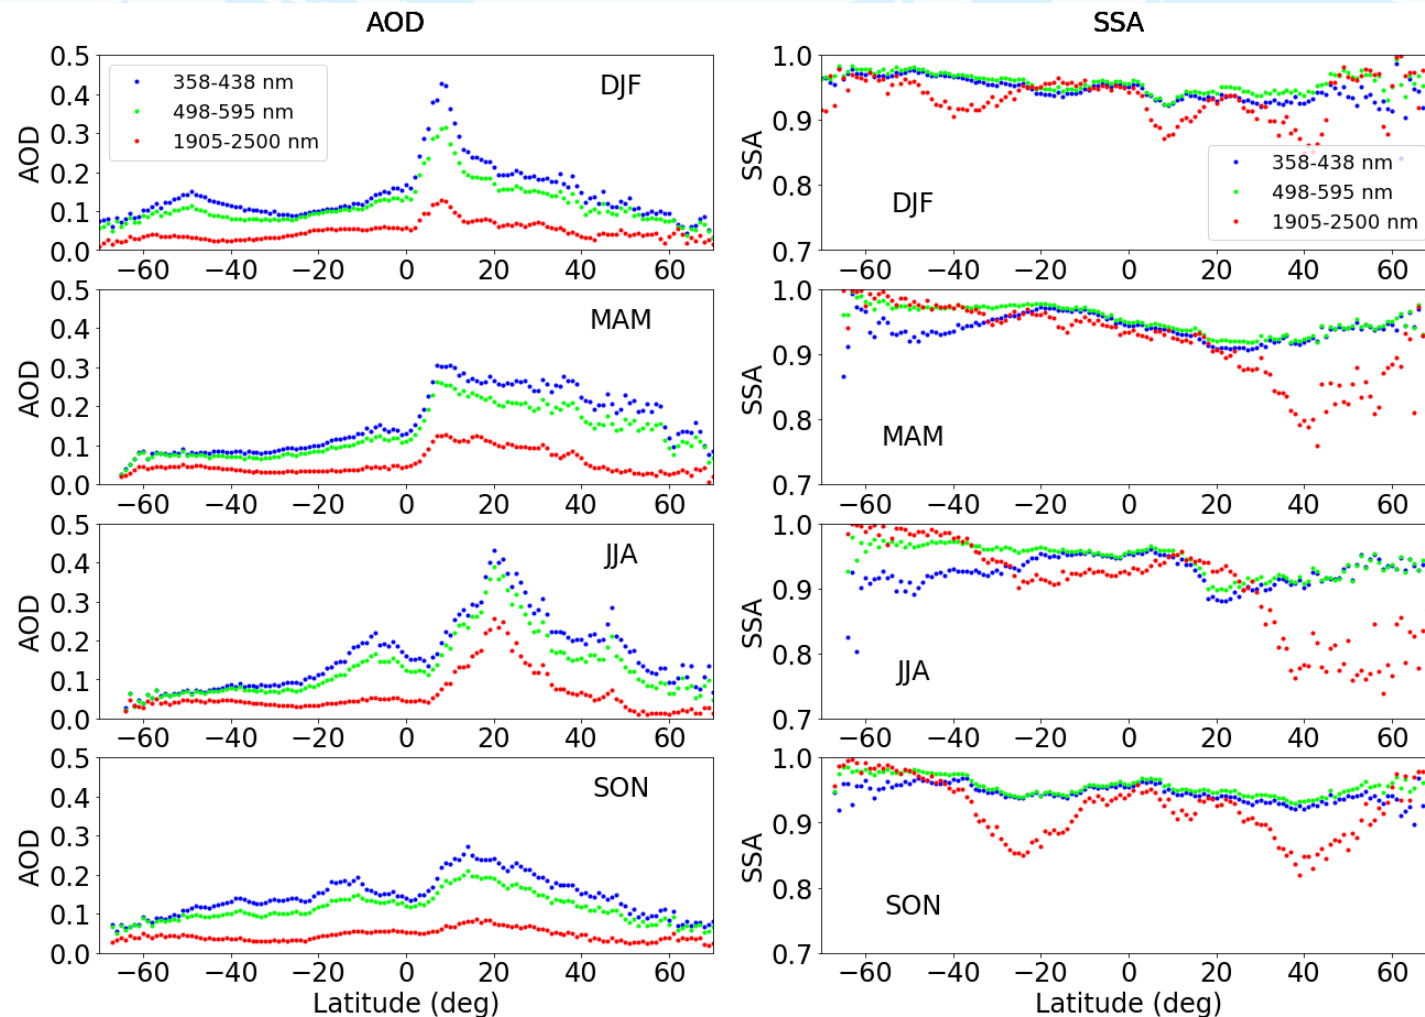

- 1) Use instantaneously collocated L2 data from MODIS, OMI, CALIOP (MOC)
- 2) Check whether collocated data from any given sensor is consistent with the pdf of the sensor's global data set
- 3) Observe satellite data quality flags
- 4) Use aerosol models that are consistent with in situ data sets from various field campaigns
- 5) Different choices for different locales:

Locale → Data ↓	Land - Dark target	Land - Enhanced Deep blue	Ocean
MODIS AOD 550nm 1240nm	Corr._O._D._Land (QA_Land=3) 550 nm provided 1240 nm extrapolated from 470, 550, 660 nm	D._B._Spec._A._O._D. _Land (QA_Flag=3) 550 nm provided 1240 nm extrapolated from 412, 470, 660nm	Eff._O._D._Avg_Ocean (QA_Ocean=1,2,3) 550 nm provided 1240 nm provided
OMI AAOD 388 nm	OMAERUV A.S.S.A.VsHeight (QA=0) SSA 388 nm provided + MODIS AOD 388 nm extrapolated from 470, 550, 660 nm	OMAERUV A.S.S.A.VsHeight (QA=0) SSA 388 nm provided + MODIS AOD 388 nm extrapolated from 412, 470, 660nm	OMAERO S.S.A.MW (QA=0) SSA 388nm provided + MODIS AOD 388nm extrapolated from seven bands 470- 2120
CALIOP A. backscat 532 nm	CALIOP integrated backscatter screening according to Redemann et al. 2012 (CALIOP zmax-zmin)

24-hr forcing at TOA (W/sq m) annual -3.6(-3.2)

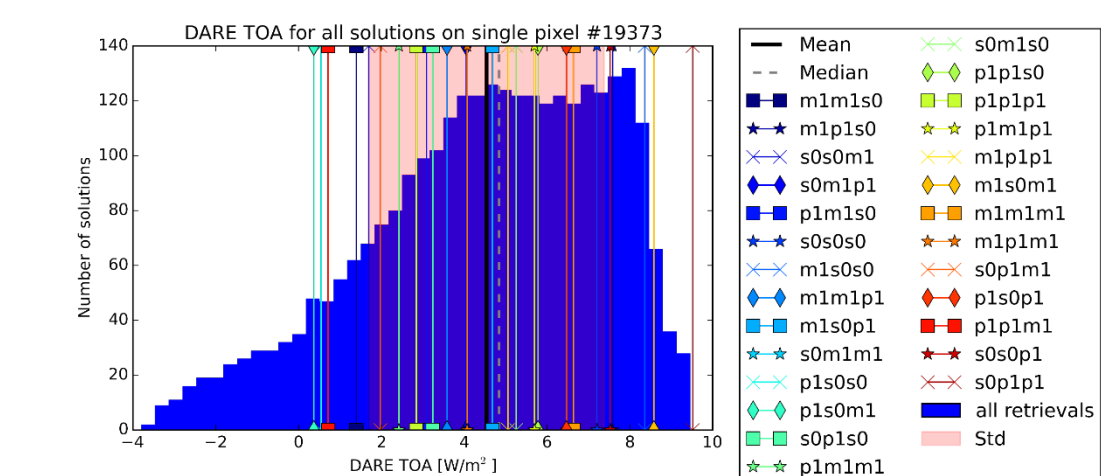

Approach: use A-Train aerosol obs to constrain aerosol radiative properties and to calculate observationally-based DARE and its uncertainty

Two main sources of uncertainty in calculating DARE from observations/retrievals:
 1) $\langle DARE \rangle \neq DARE(\langle \tau_{AAC}, \omega_{AAC}, g_{AAC} \rangle, \langle A_{surface} \rangle)$

Global assessment of this uncertainty for MOC aerosol retrievals is still ongoing!

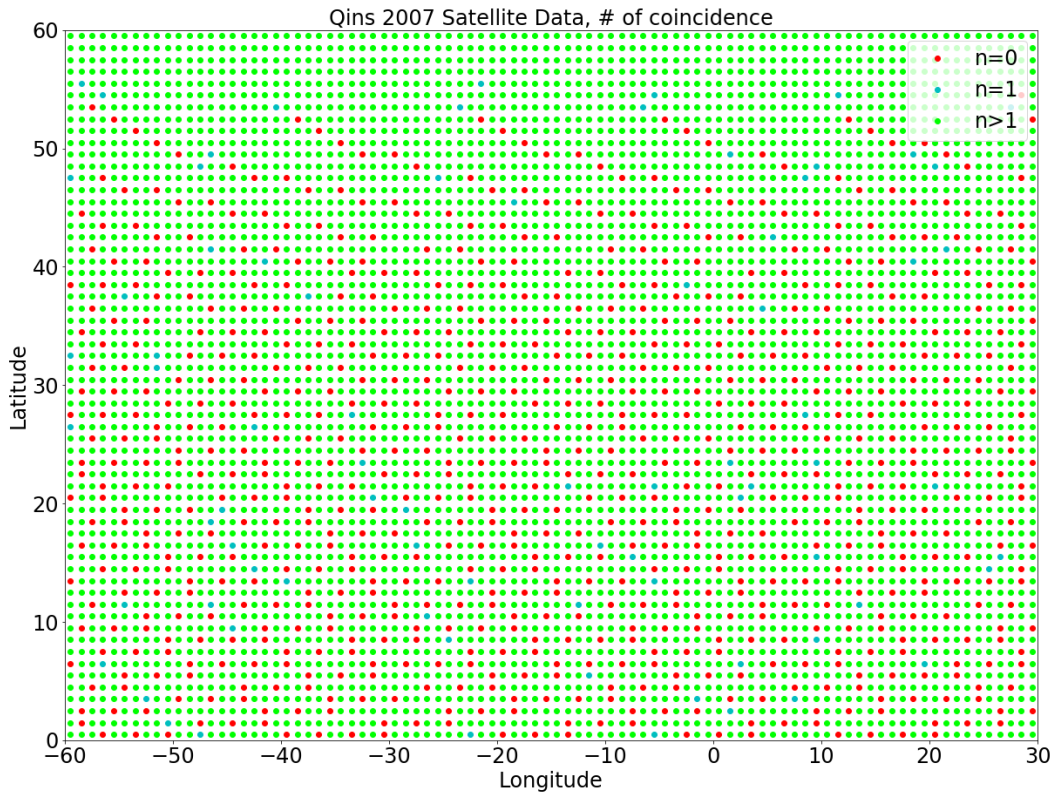

etrievals:

Approach: use A-Train aerosol obs to constrain aerosol radiative properties and to calculate observationally-based DARE and its uncertainty

Two main sources of uncertainty in calculating DARE from observations/retrievals:
2) Is observational sampling (x,t) sufficient to calculate DARE?

Idea: Use models to assess uncertainty in aerosol properties from sampling, i.e., **compare models at full resolution to models at MOC sampling!**

Comparison of A-Train MOC to 4 climate models: Seasonal AOD, SSA, DARE-TOA, DARE-surface

Conclusions

1. Combined A-Train (MODIS, OMI and CALIOP L2 - MOC) retrievals yield aerosol properties that agree better with AERONET in terms of SSA(441nm) than input OMI+MODIS data.
2. Assessments of clear-sky Direct Aerosol Radiative Effects (DARE) from observations have uncertainties
 - A. from translating the mean and range of aerosol properties into a mean and range of DARE, and
 - B. from spatial/temporal sampling.
3. Using three climate models we find **the impact of temporal sampling** for seasonal
 - A. zonal mean AOD was less than 0.05 at all latitudes, and
 - B. zonal mean SSA was generally less than 0.03 at all latitudes except N of 50N in ECHAM-HAM, and
 - C. DARE (clear-sky) is affected by ~10% in JJA season when MOC sampling is sparse in NH (>30°N).
4. Do models produce proper temporal variation in aerosol properties?
5. A-Train MOC derived clear-sky seasonal DARE @TOA and @SFC agree best with GMI-MERRA. Neither show the clear seasonal cycle in AOD, SSA and DARE, which was prevalent in most models to date.
