Aerosol radiative forcing remains uncertain...

AeroCom Workshop 2013 in Paris

Aerosol radiative forcing remains uncertain...

What are we going to do about this?

Discussion: Constraining Forcing Uncertainty

IPCC AR5 Aerosol Radiative Forcing

Climate Processes Group

(Boucher et al., IPCC AR5, Figure 7.19, 2013)

IPCC AR5 Aerosol Radiative Forcing

Models: - 1.38 Wm^{-2}

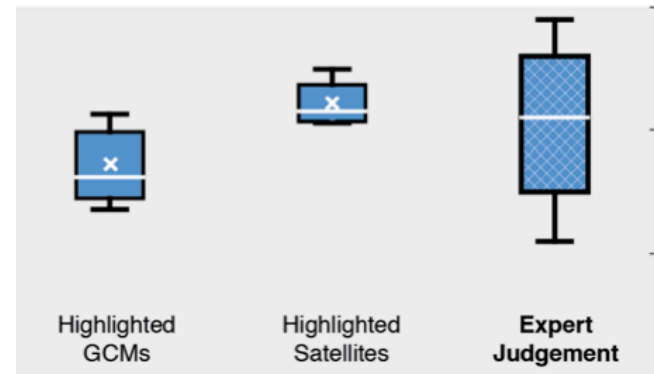

Satellites: - 0.85 Wm^{-2}

Experts: - 0.9 Wm^{-2}

Satellites: 91% weight

- ★ with mixed-phase ACI
- ◆ with convective ACI
- satellites

Climate Processes Group

(Boucher et al., IPCC AR5, Figure 7.19, 2013)

IPCC AR5 Aerosol Radiative Forcing

Models: - 1.38 Wm^{-2}

Satellites: - 0.85 Wm^{-2}

Climate Processes Group

(Boucher et al., IPCC AR5, Figure 7.19, 2013)

Constraining Forcing Uncertainty

How can AeroCom help to constrain (or bound) forcing uncertainty?

Constraining Forcing Uncertainty

How can AeroCom help to constrain forcing uncertainty?

Bottom up:

- Evaluation of **base state**:
AeroCom Control, In-situ, Nitrate, GASSP aircraft, CCN, Biomass Burning, RemoteSensing, Dust, UTLS, ACRI,...
- Evaluation of **response of cloud processes**:
Indirect I/II, ...

Top-down:

- Constraints from **transient temperature record**
- **Broadband radiation** observations (CERES, BSRN,...)
- **Plausibility – Many modelling centers tuned down ERF_{aci}**

Constraining Forcing Uncertainty

How can AeroCom help to constrain forcing uncertainty?

Discussion on constraints:

1. Bottom-up
2. Top-down

How can we pull through the results from AeroCom bottom-up experiments to deliver actual constraints on forcing (for AR6)?

Constraining Forcing Uncertainty

Comparison of ECHAM-HAM and Stevens (2015):
